Executive Summary

AECOM Australia Pty Ltd (AECOM) was commissioned by Malabar Coal Limited (Malabar) to complete an Aboriginal cultural heritage assessment for the Maxwell Project, a proposed underground coal mine, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area of Muswellbrook, New South Wales (NSW). This assessment forms part of an Environmental Impact Statement (EIS), which is being prepared to support a Development Application for the Maxwell Project in accordance with Part 4 of the *Environmental Planning and Assessment Act 1979* (EP&A Act).

This Aboriginal Cultural Heritage Assessment Report (ACHAR) documents the results of AECOM's assessment and has been compiled with reference to the NSW Office of Environment and Heritage's *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010a) (Consultation Requirements), *Code of Practice for Archaeological Investigation of Aboriginal Objects in New South Wales* (DECCW 2010b) and *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011).

The study area for this assessment encompasses the proposed underground mining area, inclusive of a potential impact zone buffer, as well as land required for surface development areas (Figure 2). Combined, these areas produce a study area of c. 2,330 hectares (ha) that extends south of the existing Maxwell Infrastructure as a thin transport and services corridor, expanding to a roughly circular area south of the Saddlers Creek and north of the Hunter River. The majority of land within the study area has historically been used for grazing.

Searches of the Aboriginal Heritage Information Management System (AHIMS) database were undertaken on 11 May 2018 for a 20 x 20 kilometre (km) area surrounding the study area resulting in the identification of 1,621 Aboriginal sites, comprising 1,594 open artefact sites (i.e., isolated artefacts and artefact scatters) (18 of which have associated areas of Potential Archaeological Deposit [PAD]), 15 modified trees (two with associated artefacts), five grinding groove sites, four stone quarries, one area of PAD, one midden and one burial (Table 9).

Consideration of the location of previously recorded Aboriginal sites indicates that 231 are located wholly or partially within the study area comprising 227 open artefact sites (i.e., artefact scatter and isolated artefacts), two modified trees and two stone quarries. From these sites, it is noted that the two modified tree sites (AHIMS #37-2-1945 and 37-2-1944) were assessed by Registered Aboriginal Parties (RAPs) and an arborist as not Aboriginal sites as part of the Drayton South Coal Project (AECOM 2012) and updated site cards submitted to the Office of Environment and Heritage (OEH). It is also noted that stone quarry site 'SC-QS-1/Quarry' (AHIMS# 37-2-1955) recorded by Mills (2000) within the study area was not located during AECOM's (2012) assessment or the current assessment.

Taking into account the above issues, a total of 228 Aboriginal sites comprising 227 open artefact sites and one stone quarry are recognised as being located wholly or partially within the study area. Considered of the location of previously recorded sites in relation to project elements indicates the following:

- 23 sites (all open artefact sites) are located wholly or partially within the proposed surface development areas;
- 203 sites (202 open artefact sites and one stone quarry) are located wholly or partially above the proposed underground mining area; and
- two sites (both open artefact sites) are located wholly or partially within both the proposed surface development areas and above the proposed underground mining area.

A field team of two AECOM senior heritage specialists (Geordie Oakes and Dr Darran Jordan) and RAP representatives completed an archaeological survey of the study area over nine days (15-17, 20-24 August 2018 and 24 October 2018). As noted in both Section 3.0, and the project methodology issued to RAPs on 19 July 2018, archaeological survey was proposed and completed within those portions of the study area not previously surveyed as part of the Drayton South Coal Project (AECOM 2012). Combined with the AECOM (2012) surveys, the current survey resulted in full survey coverage of the study area. During the survey, a total 47 new Aboriginal archaeological sites comprising artefact scatters and isolated artefacts were identified¹ within the study area.

Taking into account the results of the archaeological survey and previously recorded sites, a total of 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry have been identified within the study area. These include 228 previously recorded AHIMS sites and 47 new sites recorded during the current survey. Consideration of the location of sites located directly within surface development areas indicates that up to 39 open artefact sites would be wholly or partially impacted by the Project. Consideration of the location of Aboriginal sites located within proposed underground mining areas indicates that 236 sites, comprising 235 open artefact sites and one stone quarry, are located directly above the proposed underground mining area. It is noted that these sites may potentially be affected by cracking of the surface soils due to the effects of mining-induced subsidence.

In addition to completion of the ACHAR, a Cultural Values Report (CVR) was prepared by AECOM and is provided as Appendix A of this ACHAR. It is intended that the CVR be read in conjunction with the ACHAR. RAPs indicated that the study area sits within a broader cultural landscape that has cultural significance for Aboriginal people. Forming part of this cultural landscape are important landscape features such as Mount Arthur, the Hunter River, and Saddlers Creek which surround the study area as well as the Aboriginal objects (i.e., stone artefacts) identified during the archaeological survey for the Project. Landscape features, as well as Aboriginal sites, are often associated with stories or songs and form links along Aboriginal pathways. More broadly, the study area forms part of larger collection of Aboriginal places including Mount Yengo, Biame Cave in Milbrodale, the Lizard Rock at Laguna and Burning Mountain at Wingen.

A management strategy to address the impacts of the Project on the known Aboriginal archaeological resource of the study area is provided in Section 10.0. It is recommended that this strategy be detailed in an Aboriginal Cultural Heritage Management Plan (ACHMP) for the Project, prepared in consultation with RAPs, and to the satisfaction of the OEH and the Department of Planning and Environment. Subject to the grant of a Development Consent under Part 4, this ACHMP will guide the management of the known and potential Aboriginal archaeological resource of the study area, as well as identified cultural values.

Key elements of the ACHMP would include the following, which are detailed in Section 10.0 of this report:

- an archaeological salvage program;
- subsidence monitoring;
- conservation of non-impacted sites;
- Aboriginal cultural heritage awareness training;
- the procedure for managing previously unrecorded Aboriginal archaeological evidence;
- management of potential human remains;
- completion of AHIMS site cards; and
- management of an Aboriginal site database.

¹ Note, six additional sites were recorded outside the study area during the archaeological survey (37-2-5895, 37-2-5894, 37-2-5898, 37-2-5850, and 37-2-5873, 37-2-5863).

1.0 Introduction & Background

1.1 Introduction

AECOM Australia Pty Ltd (AECOM) was commissioned by Malabar Coal Limited (Malabar) to complete an Aboriginal cultural heritage assessment for the Maxwell Project (the Project), a proposed underground coal mining operation, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area (LGA) of Muswellbrook, New South Wales (NSW) (Figure 1).

Underground mining is proposed within Exploration Licence (EL) 5460, which was acquired by Malabar in February 2018. Malabar also acquired existing infrastructure within Coal Lease (CL) 229, Mining Lease (ML) 1531 and CL 395, known as the “Maxwell Infrastructure”. The Project would include the use of the substantial existing Maxwell Infrastructure, along with the development of some new infrastructure.

This assessment forms part of an Environmental Impact Statement (EIS) which has been prepared to accompany a Development Application for the Project in accordance with Part 4 of *the Environmental Planning and Assessment Act 1979* (EP&A Act).

This Aboriginal Cultural Heritage Assessment Report (ACHAR) documents the results of AECOM's assessment and has been compiled with reference to the NSW Office of Environment and Heritage's (OEH's) *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010a), *Code of Practice for Archaeological Investigation of Aboriginal Objects in New South Wales* (DECCW 2010b) and *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011). In addition, this ACHAR should be read in conjunction with the Cultural Values Report (CVR) prepared by AECOM (Appendix A).

1.2 Project Overview

The Project would involve an underground mining operation that would produce high-quality coals over a period of approximately 26 years (Figure 2).

At least 75% of coal produced by the Project would be capable of being used in the making of steel (coking coals). The balance would be export thermal coals suitable for the new generation High Efficiency, Low Emissions power generators.

The Project would involve extraction of run-of-mine (ROM) coal, from four seams within the Wittingham Coal Measures using the following underground mining methods:

- underground bord and pillar mining with partial pillar extraction in the Whynot Seam; and
- underground longwall extraction in the Woodlands Hill Seam, Arrowfield Seam and Bowfield Seam.

The substantial existing Maxwell Infrastructure would be used for handling, processing and transportation of coal for the life of the Project. The Maxwell Infrastructure includes an existing coal handling and preparation plant (CHPP), train load-out facilities and other infrastructure and services (including water management infrastructure, administration buildings, workshops and services).

A mine entry area would be developed for the Project in a natural valley in the north of EL 5460 to support underground mining and coal handling activities and provide for personnel and materials access.

ROM coal brought to the surface at the mine entry area would be transported to the Maxwell Infrastructure area. Early ROM coal would be transported via internal roads during the construction and commissioning of a covered overland conveyor system. Subsequently, ROM coal would be transported to the Maxwell Infrastructure area via the covered overland conveyor system.

The existing product coal stockpile area at the Maxwell Infrastructure would be extended to allow for better management of different product coal blends. An additional ROM stockpile would also be developed adjacent to the CHPP to cater for delivery of ROM coal via the covered overland conveyor.

The Project would support continued rehabilitation of previously mined areas and overburden emplacement areas within CL 229, ML 1531 and CL 395. The volume of the East Void would be reduced through the emplacement of reject material generated by the Project's coal processing activities and would be capped and rehabilitated at the completion of mining.

A detailed description of the Project will be provided in the main document of the EIS.

The Project would include a number of key components, some of which require surface disturbance, including:

1. Mine entry area to access the underground mining areas – approximately 48 hectares (ha).
2. Transport and services corridor – approximately 104 ha outside of the existing mining disturbance.
3. Potential for re-alignment of Edderton Road – approximately 10 ha.
4. Product stockpile expansion – approximately 5 ha.
5. Other works and ancillary infrastructure.
6. Subsidence zone – area within the underground mining area and surrounds.

Mine Entry Area

The mine entry area would include infrastructure, services and facilities that would support underground mining and coal handling activities and provide for personnel and materials access to the underground mine. The mine entry area would also include ventilation infrastructure.

Transport and Services Corridor

The transport and services corridor would include:

- a site access road from the Maxwell Infrastructure; and
- a covered overland conveyor system to transport ROM coal from the mine entry area to the existing CHPP at the Maxwell Infrastructure.

The transportation of early ROM coal from the mine entry area to the existing CHPP would also occur via the internal roads within the transport and services corridor.

Edderton Road Realignment

Potential subsidence impacts on Edderton Road would be managed through either road maintenance along the existing alignment or realignment of the road around the underground mining area. This ACHAR conservatively assesses the potential impacts associated with realigning Edderton Road. The potential Edderton Road realignment would intersect the Golden Highway approximately 1 kilometre (km) to the west of the current intersection.

Product Stockpile Expansion

It is proposed to increase the capacity of the existing product stockpiles. An additional product stockpile would be constructed to the east of the existing product stockpiles, with a total area of 5 ha (some of which is previously approved disturbance).

Other Works and Ancillary Infrastructure

Other works and ancillary infrastructure would occur outside of the defined surface development areas throughout the life of the Project. These works would include, but not be limited to, environmental and subsidence monitoring activities, remediation of subsidence impacts, exploration, development of service boreholes, site maintenance activities and other minor ancillary works. These surface disturbances would be temporary and isolated in nature. The surface disturbances would occur progressively and these areas would be rehabilitated when no longer required.

1.3 Study Area

The study area for this assessment includes three spatially discrete parcels of land encompassing the proposed underground mining area, inclusive of a potential impact zone buffer, as well as land required for surface infrastructure (i.e., transport and services corridor, Edderton Road realignment, product stockpile expansion, etc.) (Figure 3). Combined, these areas produce a study area of c. 2,330 ha that extends south of the existing Maxwell Infrastructure as a thin transport and services corridor, expanding to a roughly circular area south of Saddlers Creek and north of the Hunter River. The majority of land within the study area has historically, been used for grazing. Components of the Project that will occur on previously mined land have been excluded from the study area for this assessment. Cadastral information for the study area is provided in Appendix B.

1.4 Proponent and Planning Approval Process

Maxwell Ventures (Management) Pty Ltd, a wholly owned subsidiary of Malabar, is seeking consent for the Project under the State Significant Development (SSD) provisions of Part 4 of the EP&A Act and the NSW *Environmental Planning and Assessment Regulation, 2000*. An EIS is being prepared to accompany the Development Application for the Project.

1.5 Secretary's Environmental Assessment Requirements (SEARs)

The Secretary of the NSW Department of Planning and Environment (DP&E) issued the Secretary's Environmental Assessment Requirements (SEARs) for the Project on 3 September 2018, supplementary SEARs on 20 November 2018 and revised SEARs on 17 January 2019 (Appendix C). For Aboriginal heritage, the SEARs require the proponent to undertake:

- *an assessment of the potential impacts of the development on Aboriginal heritage (cultural and archaeological), including consultation with relevant Aboriginal communities/parties and documentation of the views of these stakeholders regarding the likely impact of the development on their cultural heritage;*

In addition to the project SEARs, OEHL issued specific requirements (Attachment A) for the project in relation to Aboriginal heritage. These included:

5 The Environmental Impact Assessment (EIS) must identify and describe the Aboriginal cultural heritage values that exist across the whole area that will be affected by the development and document these in the Aboriginal Cultural Heritage Assessment Report (ACHAR). This may include the need for surface survey and test excavation. The identification of cultural heritage values should be guided by the Guide to investigating, assessing and reporting on Aboriginal Cultural Heritage in NSW (DECCW, 2011) and consultation with OEHL regional branch officers.

6 Consultation with Aboriginal people must be undertaken and documented in accordance with the Aboriginal cultural heritage consultation requirements for proponents 2010 (DECCW). The significance of cultural heritage values for Aboriginal people who have a cultural association with the land must be documented in the ACHAR.

7 Impacts on Aboriginal cultural heritage values are to be assessed and documented in the ACHAR. The ACHAR must demonstrate attempts to avoid impact upon cultural heritage values and identify any conservation outcomes. Where impacts are unavoidable, the ACHAR must outline measures proposed to mitigate impacts. Any objects recorded as part of the assessment must be documented and notified to OEHL.

In preparing this ACHAR the SEARs issued for the Project have been addressed.

1.6 Assessment Objectives

The overarching objectives of this ACHAR are as follows:

- to identify the Aboriginal cultural heritage values of the study area by way of background research, archaeological survey and consultation with Registered Aboriginal Parties (RAPs);
- to assess the potential impact of the Project on the identified Aboriginal cultural heritage values of the study area;
- to provide an appropriate management strategy for avoiding or minimising potential harm to the identified Aboriginal cultural heritage values of the study area; and
- to compile an ACHAR that will assist the Secretary of the DP&E in their assessment of the current SSD application.

1.7 Scope of Current Assessment

This assessment has been undertaken in accordance with the SEARs, clause 80C of the NSW *National Parks and Wildlife Regulation 2009* and with reference to the following guidelines:

- *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011);
- *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010a);
- *Code of Practice for Archaeological Investigation of Aboriginal Objects in New South Wales* (DECCW 2010b);
- *The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance* (Australia International Council on Monuments and Sites [ICOMOS] 2013);
- *Ask First: A Guide to Respecting Indigenous Heritage Places and Values* (Australian Heritage Commission 2002); and
- *Engage Early* (Australian Government Department of the Environment 2016).

As such, its key requirements have been:

- to conduct a search of OEH's Aboriginal Heritage Information Management System (AHIMS);
- to review the landscape context of the study area, with specific consideration to its implications for past Aboriginal land use;
- to review relevant archaeological and ethnohistoric information for the study area and environs;
- to prepare a predictive model for the Aboriginal archaeological record of the study area;
- to undertake an archaeological field investigation including detailed survey;
- to identify, notify and register Aboriginal people who hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects and/or places in the study area;
- to provide RAPs with information about the scope of the proposed works and Aboriginal heritage assessment process;
- to facilitate a process whereby RAPs can:
 - contribute culturally appropriate information to the proposed assessment methodology;
 - provide information that will enable the cultural significance of Aboriginal objects and/or places within the study area to be determined;
 - have input into the development of cultural heritage management options; and
- to prepare and finalise an ACHAR with input from RAPs.

1.8 Project Team

Geordie Oakes (Principal Heritage Specialist, AECOM) managed all aspects of the Aboriginal heritage assessment detailed herein and was the primary author of this report. Dr Darran Jordan (Principal Heritage Specialist, AECOM) assisted Geordie with fieldwork. Dr Andrew McLaren (Senior Heritage Specialist, AECOM) provided technical review of this assessment report.

The archaeological survey was undertaken by a combined field team of two AECOM archaeologists (Geordie and Darran) and RAP field representatives (as described in Section 3.3.2).

Geordie holds a Bachelor of Arts (Honours) degree in historic and prehistoric Archaeology from Sydney University and a Graduate Certificate in Paleo-anthropology from the University of New England. Geordie has over ten years of Australian Aboriginal cultural heritage management experience.

Darran holds a Bachelor of Arts (Honours) degree and a PhD from Sydney University and has over 10 years of Australian Aboriginal cultural heritage management experience.

Andrew holds a Bachelor of Arts (Honours) degree from the University of Queensland, a Master of Cultural Heritage from Deakin University, and a PhD from the University of Cambridge in England and has over 10 years of Australian Aboriginal cultural heritage management experience.

1.9 Report Structure

This report contains eleven sections. This section - **Section 1.0** - has provided background information on the Project and assessment undertaken. The remainder of the report is structured as follows:

- **Section 2.0** outlines the statutory framework within which this assessment has been undertaken;
- **Section 3.0** details the Aboriginal community consultation program undertaken for this assessment;
- **Section 4.0** describes the existing environment of the study area and its associated archaeological implications;
- **Section 5.0** summarises relevant ethnohistoric information for the study area;
- **Section 6.0** describes the archaeological context of the study area on a regional and local scale. Predictions regarding the nature of the study area's Aboriginal archaeological record are also provided;
- **Section 7.0** describes the archaeological survey methodology and survey results;
- **Section 8.0** assesses the archaeological (scientific) and cultural significance of Aboriginal sites within the study area;
- **Section 9.0** provides an assessment of the potential impacts of the Project on identified Aboriginal heritage values;
- **Section 10.0** provides details on the design of the Project and strategies to avoid and minimise harm to Aboriginal heritage values;
- **Section 11.0** details an appropriate management strategy for the identified Aboriginal heritage values of the study area; and
- **Section 12.0** lists the references cited in-text.

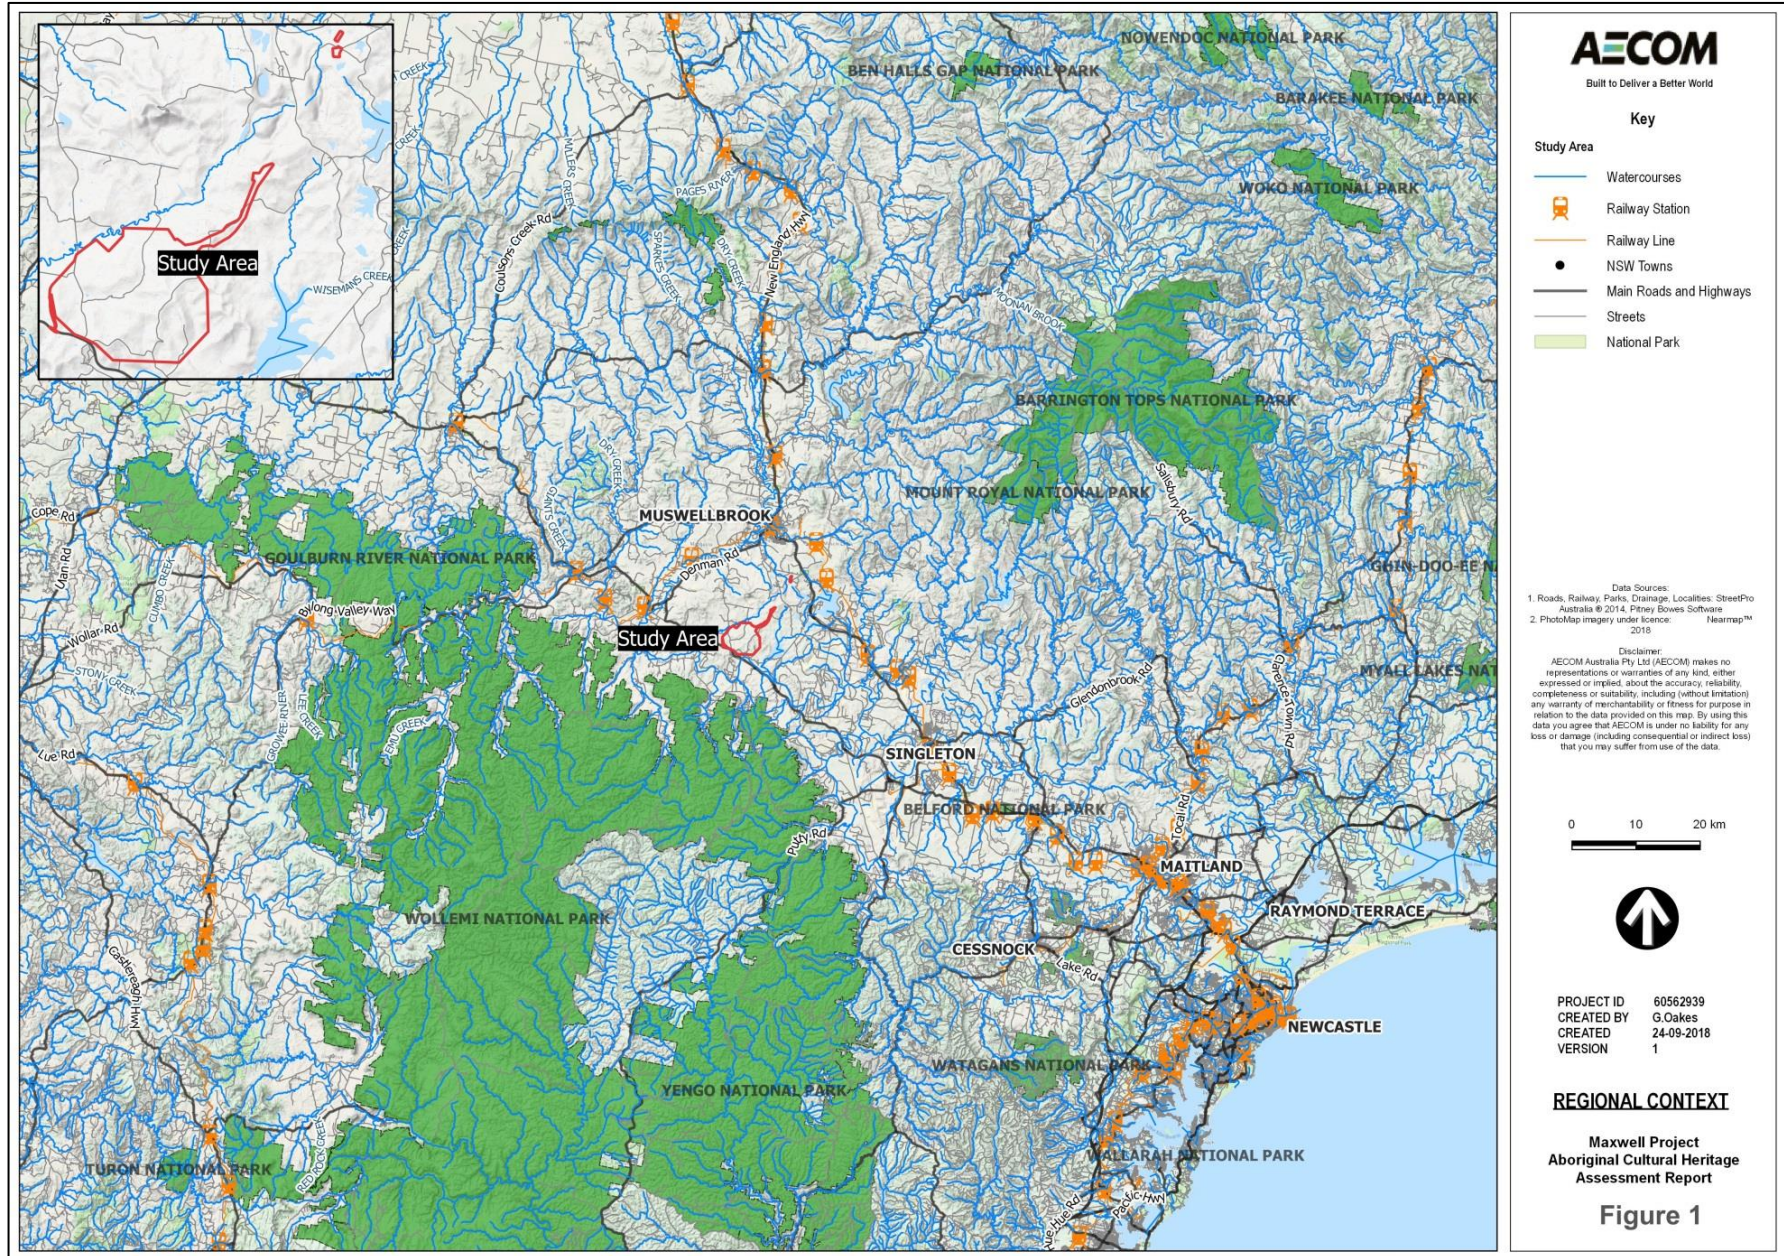

Figure 2 Project General Arrangement (Source: Malabar 2019)

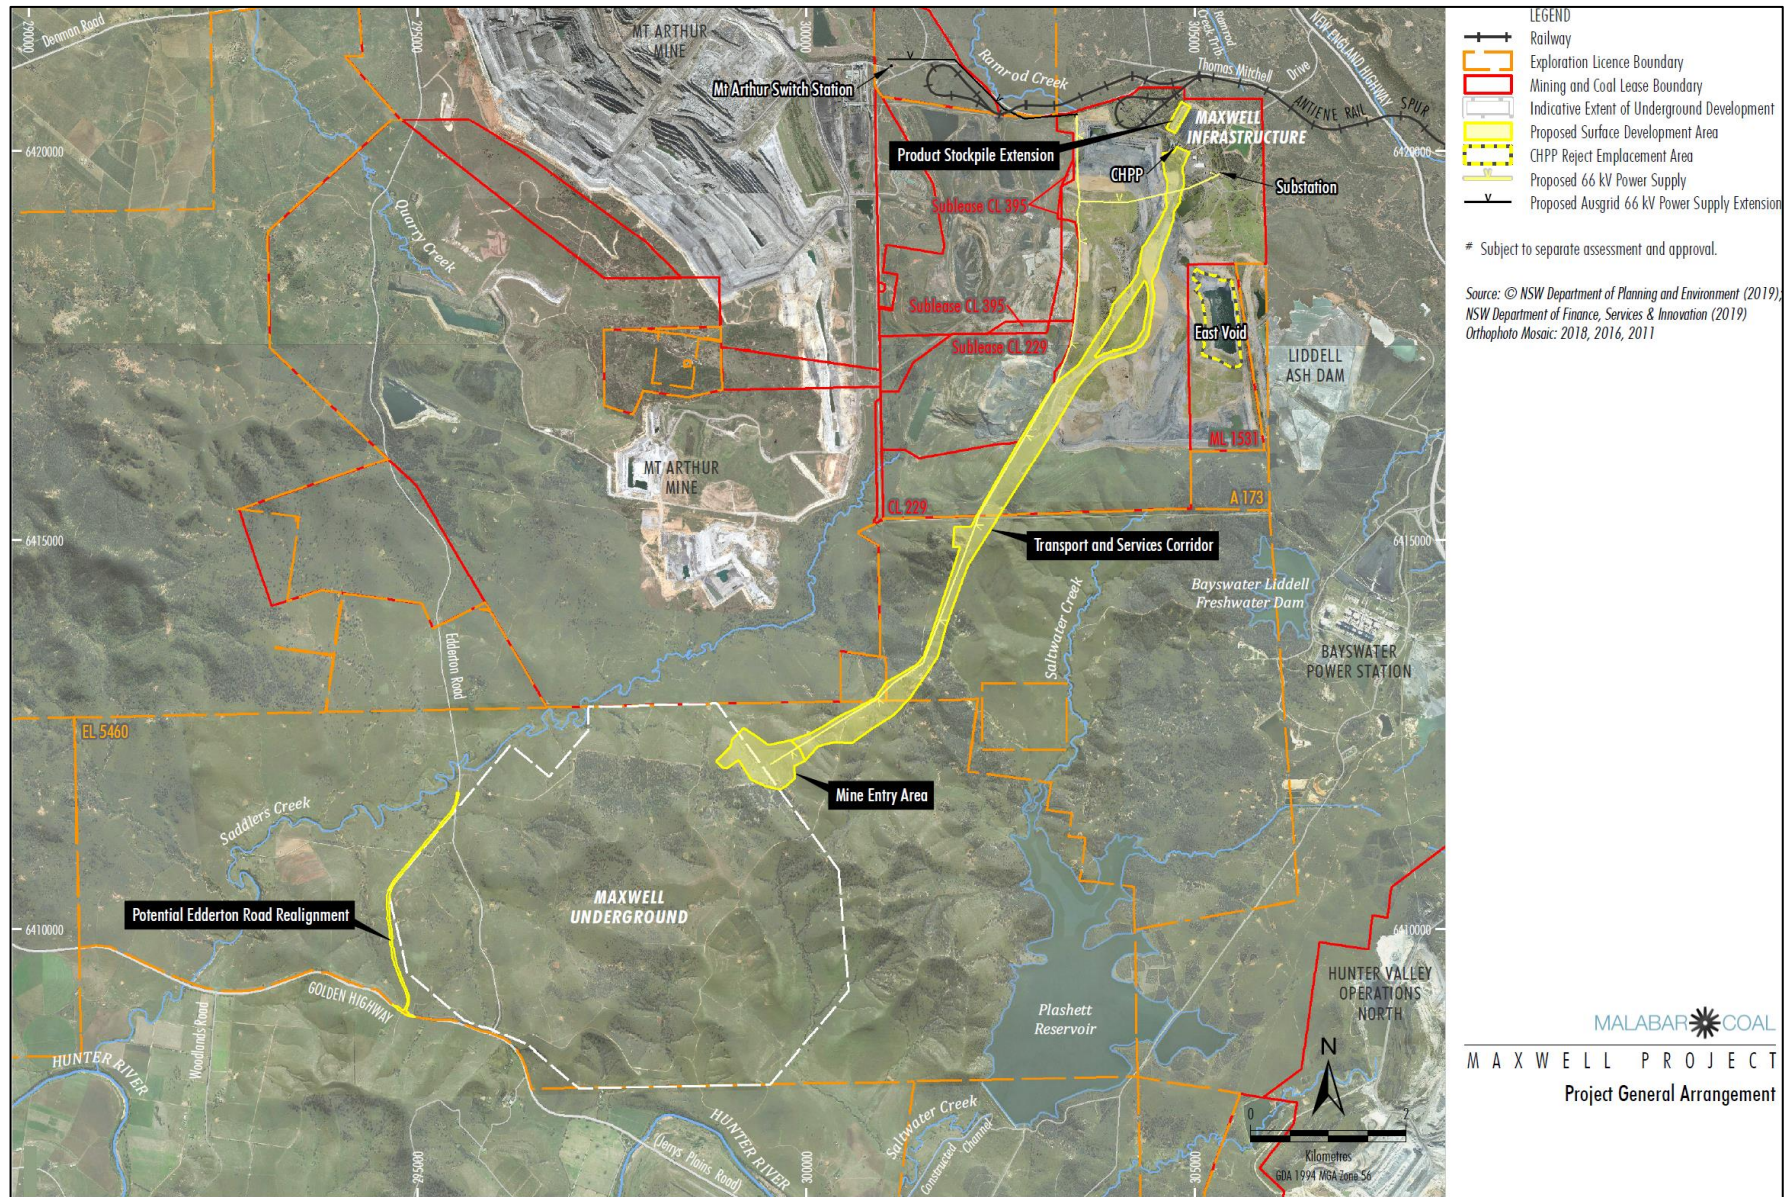

Figure 3 Study Area

2.0 Applicable Policy & Legislation

2.1 Commonwealth Legislation

2.1.1 Aboriginal and Torres Strait Islander Heritage Protection Act 1984

The *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (the ATSIHP Act) provides for the preservation and protection of places, areas and objects of particular significance to Indigenous Australians. The stated purpose of the ATSIHP Act is the “*preservation and protection from injury or desecration of areas and objects in Australia and in Australian waters, being areas and objects that are of particular significance to Aboriginals in accordance with Aboriginal tradition*” (Part I, Section 4).

Under the ATSIHP Act, ‘*Aboriginal tradition*’ is defined as “*the body of traditions, observances, customs and beliefs of Aboriginals generally or of a particular community or group of Aboriginals, and includes any such traditions, observances, customs or beliefs relating to particular persons, areas, objects or relationships*” (Part I, Section 3). A ‘*significant Aboriginal area*’ is an area of land or water in Australia that is of “*particular significance to Aboriginals in accordance with Aboriginal tradition*” (Part I, Section 3). A ‘*significant Aboriginal object*’, on the other hand, refers to an object (including Aboriginal remains) of like significance.

For the purposes of the ATSIHP Act, an area or object is considered to have been injured or desecrated if:

- a. *In the case of an area:*
 - i. *it is used or treated in a manner inconsistent with Aboriginal tradition;*
 - ii. *by reason of anything done in, on or near the area, the use or significance of the area in accordance with Aboriginal tradition is adversely affected; or*
 - iii. *passage through or over, or entry upon, the area by any person occurs in a manner inconsistent with Aboriginal tradition; or*
- b. *In the case of an object – it is used or treated in a manner inconsistent with Aboriginal tradition;*

The ATSIHP Act can override state and territory laws in situations where a state or territory has approved an activity, but the Commonwealth Minister prevents the activity from occurring by making a declaration to protect an area or object. However, the Minister can only make a decision after receiving a legally valid application under the ATSIHP Act and, in the case of long-term protection, after considering a report on the matter. Before making a declaration to protect an area or object in a state or territory, the Commonwealth Minister must consult the appropriate minister of that state or territory (Part 2, Section 13).

No declarations relevant to the study area have been made under the ATSIHP Act.

2.1.2 Native Title Act 1993

The *Native Title Act 1993* (NTA) provides for the recognition and protection of native title for Aboriginal peoples and Torres Strait Islanders. The NTA recognises native title for land over which native title has not been extinguished and where persons able to establish native title are able to prove continuous use, occupation or other classes of behaviour and actions consistent with a traditional cultural possession of those lands. It also makes provision for Indigenous Land Use Agreements (ILUA) to be formed as well as a framework for notification of native title Stakeholders for certain future acts on land where native title has not been extinguished.

Searches of the *Schedule of Applications (unregistered claimant applications)*, *Register of Native Title Claims*, *National Native Title Register*, *Register of Indigenous Land Use Agreements* and *Notified Indigenous Land Use Agreements* were undertaken in June 2018, with one Native Title Registration Claim (not determined) identified for the study area - Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People (PCWP) (Claim ID number NC2013/006).

2.1.3 Environment Protection and Biodiversity Act 1999

The Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) took effect on 16 July 2000. Under Part 9 of the EPBC Act, any action that is likely to have a significant impact on a matter of National Environmental Significance may only progress with approval of the Commonwealth Minister for the Environment (or delegate). An action is defined as a project, development, undertaking, activity, series of activities, or alteration. An action will also require approval if:

- it is undertaken on Commonwealth land and will have or is likely to have a significant impact;
- it is undertaken outside Commonwealth land and will have or is likely to have a significant impact on the environment on Commonwealth land; or
- it is undertaken by the Commonwealth and will have or is likely to have a significant impact.

The EPBC Act defines 'environment' as incorporating both natural and cultural environments and therefore includes Aboriginal heritage. Under the Act, protected heritage items are listed on the National Heritage List (items of significance to the nation) or the Commonwealth Heritage List (items belonging to the Commonwealth or its agencies). These two lists replaced the Register of the National Estate (RNE), which was closed in 2007 and is no longer a statutory list. Statutory references to the RNE in the EPBC Act were removed on 19 February 2012. However, the RNE remains an archive of over 13,000 heritage places throughout Australia.

Searches of the National Heritage List, Commonwealth Heritage List and RNE were undertaken in June 2018, with no relevant listings identified for the study area.

2.2 State Legislation

2.2.1 Environmental Planning and Assessment Act 1979

The *Environmental Planning and Assessment Act 1979* (EP&A Act), administered by DP&E, requires that consideration be given to environmental impacts as part of the land use planning process in NSW. In NSW, environmental impacts are interpreted as including impacts to Aboriginal and non-Aboriginal (i.e., European) cultural heritage.

Section 4.36 of the EP&A Act stipulates that a development will be considered State Significant Development (SSD) if it is declared to be such by a State environmental planning policy.

Under Clause 8(1) of *State Environmental Planning Policy (State and Regional Development) 2011* (SEPP SRD), a development is declared to be SSD if:

- a. the development on the land concerned is, by the operation of an environmental planning instrument, permissible with development consent under Part 4 of the EP&A Act; and
- b. the development is specified in Schedule 1 or 2 of SEPP SRD.

The Project is SSD as it meets both of these criteria, namely:

- it is permissible with development consent on the land on which it is located; and
- it is development that is specified in Schedule 1 of SEPP SRD.

Pursuant to Section 4.41 of the EP&A Act, Aboriginal Heritage Impact Permits (AHIPs) are not required for projects classified as SSD and approved under Part 4 of the EP&A Act. Impacts to Aboriginal heritage values associated with approved SSD projects are typically managed under Aboriginal Cultural Heritage Management Plans (ACHMPs), required under the conditions of the consent. ACHMPs are statutorily binding once approved by the DP&E.

Section 89A of the *National Parks and Wildlife Act 1974* (NPW Act) requires notification of the location of Aboriginal sites within a reasonable time, with penalties for non-notification. Section 89A is binding in all instances, including for SSD projects.

2.2.2 Aboriginal Land Rights Act 1983

The *Aboriginal Land Rights Act 1983* (ALR Act) was established to return land in NSW to Aboriginal peoples through a process of lodging claims for certain Crown lands. The Act, administered by the NSW Department of Aboriginal Affairs, is a compensatory regime which recognises that land is of spiritual, social, cultural and economic importance to Aboriginal people. The ALR Act established the NSW Aboriginal Land Council (NSWALC) and a network of over 120 autonomous Local Aboriginal Land Councils (LALCs) and requires these bodies to:

- a. take action to protect the culture and heritage of Aboriginal persons in the LALC's area, subject to any other law; and
- b. promote awareness in the community of the culture and heritage of Aboriginal persons in the LALC's area.

LALCs constituted under the ALR Act can make claims. The Registrar of the ALR Act is responsible for maintaining the Register of Aboriginal Land Claims under section 166 of the Act. All land claims that have been made since the Act came into force in 1983 have been recorded in the Register.

Consultation with the Registrar of the ALR Act in June 2018 has indicated that the study area does not have any Registered Aboriginal Owners pursuant to Division 3 of the ALR Act.

2.2.3 National Parks and Wildlife Act 1974

The *National Parks and Wildlife Act 1974* (NPW Act), administered by the OEH, is the primary legislation for the protection of Aboriginal cultural heritage in NSW. The NPW Act gives the Secretary of the OEH responsibility for the proper care, preservation and protection of 'Aboriginal objects' and 'Aboriginal places', defined under the Act as follows:

- An *Aboriginal object* is any deposit, object or material evidence (that is not a handicraft made for sale) relating to Aboriginal habitation of NSW, before or during the occupation of that area by persons of non-Aboriginal extraction (and includes Aboriginal remains).
- An *Aboriginal place* is a place so declared by the Minister administering the NPW Act because the place is or was of special significance to Aboriginal culture. It may or may not contain Aboriginal objects.

Part 6 of the NPW Act provides specific protection for Aboriginal objects and places by making it an offence to harm them and includes a 'strict liability offence' for such harm. A 'strict liability offence' does not require someone to know that it is an Aboriginal object or place they are causing harm to in order to be prosecuted. Defences against the 'strict liability offence' in the NPW Act include the carrying out of certain 'Low Impact Activities', prescribed in Clause 80B of the *National Parks and Wildlife Amendment (Aboriginal Objects and Aboriginal Places) Regulation 2010* (NPW Regulation), and the demonstration of due diligence.

An Aboriginal Heritage Impact Permit (AHIP) issued under Section 90 of the NPW Act is required if impacts to Aboriginal objects and/or places cannot be avoided. An AHIP is a defence to a prosecution for harming Aboriginal objects and places if the harm was authorised by the AHIP and the conditions of that AHIP were not contravened. Applications for an AHIP must be accompanied by assessment reports compiled in accordance with the *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011) and the *Code of Practice for Archaeological Investigation of Aboriginal Objects in NSW* (DECCW 2010b). Applications must also provide evidence of consultation with the Aboriginal communities. Consultation is required under Part 8A of the NPW Regulation and is to be conducted in accordance with the *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010a). AHIPs may be issued in relation to a specified Aboriginal object, Aboriginal place, land, activity or person or specified types or classes of Aboriginal objects, Aboriginal places, land, activities or persons.

As indicated in Section 2.2.1, pursuant to Section 4.41 of the EP&A Act, AHIPs are not required for projects classified as SSD and approved under Part 4 of the EP&A Act, with impacts typically managed under ACHMPs required under the conditions of the consent. ACHMPs are statutorily binding once approved by the DP&E.

Section 89A of the NPW Act requires notification of the location of Aboriginal sites within a reasonable time, with penalties for non-notification. Section 89A is binding in all instances, including for SSD projects.

2.3 Local Government

2.3.1 Muswellbrook Local Environmental Plan 2009

Clause 5.10 of the *Muswellbrook Local Environmental Plan 2009* (MLEP 2009) provides specific provisions for the protection of heritage items, heritage conservation areas, archaeological sites, Aboriginal objects and Aboriginal places of heritage significance within the Muswellbrook LGA.

Under Subsection 2 of Clause 5.10 of the MLEP 2009, development consent is required for any of the following:

- a. demolishing or moving any of the following or altering the exterior of any of the following (including, in the case of a building, making changes to its detail, fabric, finish or appearance):
 - (i) a heritage item,
 - (ii) an Aboriginal object,
 - (iii) a building, work, relic or tree within a heritage conservation area,
- b. altering a heritage item that is a building by making structural changes to its interior or by making changes to anything inside the item that is specified in Schedule 5 in relation to the item,
- c. disturbing or excavating an archaeological site while knowing, or having reasonable cause to suspect, that the disturbance or excavation will or is likely to result in a relic being discovered, exposed, moved, damaged or destroyed,
- d. disturbing or excavating an Aboriginal place of heritage significance,
- e. erecting a building on land:
 - (i) on which a heritage item is located or that is within a heritage conservation area, or
 - (ii) on which an Aboriginal object is located or that is within an Aboriginal place of heritage significance,
- f. subdividing land:
 - (i) on which a heritage item is located or that is within a heritage conservation area, or
 - (ii) on which an Aboriginal object is located or that is within an Aboriginal place of heritage significance.

In relation to Aboriginal heritage, Subsection 8 of Clause 5.8 of the MLEP 2009 states the consent authority must, before granting consent under this clause to the carrying out of development in an Aboriginal place of heritage significance:

- a. consider the effect of the proposed development on the heritage significance of the place and any Aboriginal object known or reasonably likely to be located at the place by means of an adequate investigation and assessment (which may involve consideration of a heritage impact statement), and
- b. notify the local Aboriginal communities, in writing or in such other manner as may be appropriate, about the application and take into consideration any response received within 28 days after the notice is sent.

Schedule 5 of the MLEP 2009 provides a list of heritage items, conservation areas and archaeological sites within the Muswellbrook LGA. A review of the list indicates there are no Aboriginal objects or places of heritage significance located within the study area.

The consent authority is required to comply with relevant requirements of Clause 5.10 for the Project.

3.0 Aboriginal Community Consultation

Aboriginal community consultation acknowledges the right of Aboriginal people to be involved, through direct participation, on matters that directly affect their heritage. Involving Aboriginal people in all facets of the assessment process ensures that they are given adequate opportunity to share information about cultural values, and to actively participate in the development of appropriate management and/or mitigation measures. The successful identification, assessment and management of Aboriginal cultural heritage values are dependent on an inclusive and transparent consultation process.

Aboriginal community consultation for the current assessment was undertaken in accordance with OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW 2010a) (Consultation Requirements) and clause 80C of the NSW *National Parks and Wildlife Regulation 2009*. The results of the consultation process undertaken are detailed below. Associated correspondence is provided in Appendices D to J.

3.1 Stage 1 - Notification and Registration

The aim of Stage 1 of the Consultation Requirements is to identify, notify and register Aboriginal people who hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects and/or places in the study area.

3.1.1 Consultation with Regulatory Agencies

Section 4.1.2 of the Consultation Requirements stipulates that proponents are responsible for ascertaining, from reasonable sources of information, the names of Aboriginal people who may hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects and/or places. Proponents are required to compile a list of Aboriginal people who may have an interest for the proposed study area and hold knowledge relevant to determining the cultural significance of Aboriginal objects and/or places by writing to:

- a. the relevant regional office of the OEH;
- b. the relevant Local Aboriginal Land Council(s) (LALCs);
- c. the Registrar, *Aboriginal Land Rights Act 1983* for a list of Aboriginal owners;
- d. the National Native Title Tribunal for a list of registered native title claimants, native title holders and registered Indigenous Land Use Agreements;
- e. NTSCORP Limited;
- f. the relevant local council(s); and
- g. the relevant catchment management authorities for contact details of any established Aboriginal reference group (now Local Land Services).

In accordance with this requirement, the following agencies were contacted via letter or email on 31 May 2018 requesting information on relevant Aboriginal persons and organisations (Appendix D):

- OEH;
- Wanaruah Local Aboriginal Land Council (WLALC);
- Office of the Registrar, *Aboriginal Land Rights Act 1983* (NSW);
- National Native Title Tribunal;
- NTSCORP Limited;
- Muswellbrook Shire Council;
- Singleton Council; and
- Hunter Local Land Services (HLLS).

Responses were received from four agencies and are attached as Appendix E:

- Singleton Council responded on 5 June 2018 indicating the WLALC was the peak body representing Aboriginal people in the area;
- Office of Registrar responded on 6 June 2018 stating the study area does not have Registered Aboriginal Owners pursuant to Division 3 of the Aboriginal Land Rights Act 1983 (ALRA) and suggesting AECOM contact the WLALC;
- The National Native Title Tribunal responded on 13 June 2018 indicting that one Native Title Claimant was registered within the study area - Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People;
- Muswellbrook Shire Council responded on 15 June 2018 providing the names of two Aboriginal stakeholder groups - WLALC (CEO Noel Downs) and Hunter Valley Aboriginal Corporation (Manager Ross Pahuru); and
- OEH responded on 15 June 2018 providing the contact details for 50 groups and individuals that may have an interest in the development.

3.1.2 Public Notification

Section 4.1.3 of the Consultation Requirements requires that, in addition to writing to the Aboriginal people identified by the agencies listed in Section 3.1.1, the proponent must also place a notice in the local newspaper circulating in the general location of the proposed project. The notification must outline the project and identify its location.

In accordance with this requirement, a public notice was placed in the Hunter Valley News on 20 June 2018 (Appendix F). The closing date for registration via this notice was 4 July 2018, which provided the necessary minimum 14-day period for expressions of interest.

No responses were provided to the newspaper advertisement.

3.1.3 Invitations for Expressions of Interest

Section 4.1.3 of the Consultation Requirements requires that proponents must write to the Aboriginal people whose names were obtained through the regulatory agencies and the relevant Local Aboriginal Land Council(s) to notify them of the proposed project and invite them to register an interest in participating in a process of community consultation.

In accordance with this requirement, on 15 June 2018, a letter inviting expressions of interest and containing summary information on the project was sent to all Aboriginal persons and organisations identified by the regulatory agencies. A total of 50 Aboriginal stakeholders were invited to register an interest in being consulted. The closing date for registrations was 4 July 2018 allowing the necessary minimum 14-day period for expressions of interest.

A total of 27 Aboriginal organisations registered an interest in the Maxwell Project. Summary information on all RAPs, including registration dates, is provided in Table 1.

3.1.4 Notification of Registered Aboriginal Parties (RAPs)

Section 4.1.6 of the Consultation Requirements requires that the proponent make a record of the names of each Aboriginal person who registered an interest and provide a copy of that record, along with a copy of the Expression of Interest (EOI) letter forwarded to the Aboriginal parties, to the relevant OEHL regional office and LALC. Section 4.1.5 of the Consultation Requirements provides the opportunity for Aboriginal persons to withhold their details from being forwarded to these parties.

In accordance with these requirements, on 20 September 2018, a list of all RAPs that had not requested their details be withheld was forwarded to the relevant OEHL regional office and the WLALC. A copy of the EOI letter and the newspaper advertisement was included in this correspondence (Appendix G).

3.2 Stage 2 - Presentation of Information about Project

The aim of Stage 2 of the Consultation Requirements is to provide RAPs with information about the scope of the proposed project and the proposed cultural heritage assessment process.

For the current assessment, presentation of information about the study area and proposed development was provided to RAPs as part of the registration of interest process detailed in Section 3.1.3. Basic information on the proponent and proposed development was included in the EOI letter mailed on 15 June 2018. In addition, an information session was held, open to all RAPs, on Friday 10 August 2018 at the Maxwell Infrastructure site office.

3.3 Stage 3 – Gathering Information about Cultural Significance

The aim of Stage 3 of the Consultation Requirements is to facilitate a process whereby RAPs can:

- a. Contribute to culturally appropriate information gathering and the assessment methodology;
- b. Provide information that will enable the cultural significance of Aboriginal objects and/or places on the proposed study area to be determined; and
- c. To have input into the development of any cultural heritage management measures.

For current assessment, consultation with RAPs regarding the cultural heritage values of the study area included:

- a request with the draft assessment methodology for any initial comments regarding the Aboriginal cultural heritage values of the study area;
- a request during the information session held on Friday 10 August 2018 for any information regarding the Aboriginal cultural heritage values of the study area;
- discussion of cultural heritage values during fieldwork;
- offers made to RAPs for private interviews, in case the information is considered culturally sensitive;
- provision of the draft report to all RAPs for comment prior to finalisation; and
- invitation to all RAPs to attend an ACHAR discussion session following the provision of the draft ACHA.

Existing publicly available information from previous studies in the study area (as well as surrounding project sites) was also reviewed for information on cultural heritage. This included review of *Aboriginal Archaeological and Cultural Heritage Impact Assessment* (AECOM 2012, 2015) for the Drayton South Coal Project, which assessed a very similar area to the current study area.

3.3.1 Draft Assessment Methodology

Sections 4.3.1 and 4.3.2 of the Consultation Requirements require that the proponent present and/or provide the proposed methodology for the cultural heritage assessment to RAPs and that RAPs be given a minimum of 28 days to review and provide feedback on this methodology (Appendix H).

All RAPs for the current assessment were provided by mail with a draft of AECOM's proposed assessment methodology on 19 July 2018. RAPs were given a minimum of 28 days to review and provide feedback on this methodology with the closing date for comments on 21 August 2018.

Six responses were received from RAPs relating to the draft methodology. No specific cultural heritage values relating to the study area were identified by RAP respondents. RAP responses are summarised in Table 2, with written responses attached as Appendix I.

Table 2 RAP responses to draft methodology

Registered Aboriginal Party	Date	Method	Summary of response	Response
AGA Services	27-July-18	Email	Agree with the methodology	None required
Cacatua	27-July-18	Email	Agree with the methodology	None required
Wallagan Cultural Services	27-July-18	Email	Agree with the methodology	None required
Widescope	8-August-18	Email	Agree with the methodology	None required
Wonn1	16-August-18	Email	Agree with the methodology	None required

Registered Aboriginal Party	Date	Method	Summary of response	Response
Tocomwall Pty Ltd/ Scott Franks and Anor on behalf of the PCWP	25-July-18	Email	Does not support the methodology. Indicated belief that the mine is located on the Spur Hill Mining Lease Application (MLA) and AECOM has not considered documents associated with that Project. Also, expressed concern that RAPs not authorised to make comments, recommendations or support the destruction of any area within the Registered Native title area of the PCWP.	Malabar personnel met with Scott Franks to clarify that the Maxwell study area is not located on the Spur Hill MLA. Offer made for cultural interviews as part of draft ACHAR review to address concerns

3.3.2 Archaeological Survey

The following RAPs participated in the fieldwork component of this ACHAR:

Table 3 RAP field representatives by organisation

Registered Aboriginal Party	Field representative(s)
DNC	Paul Boyd
WLALC	Jamie-Lee
Wallagan Cultural Services	Maree Waugh
Culturally Aware	Tracey Skene
Wattaka Wonnarua Cultural Consultancy Services	Luke Hickey
Ungooroo Aboriginal Corporation	Allen Paget
AGA Services	Greg Sampson
Cacatua	George Sampson
Hunter Valley Aboriginal Corporation	Clifford Sampson
Murra Bidgee Mullangari	Ryan Johnson
Ungooroo culture & community service	Jade Jones
Gidawaa Walang Cultural Heritage Consultancy	Craig Horne
Yinarr Cultural Services	Kathie Steward Kinchela
Merrigarn	Beau Mason
Muragadi	Duane Sharpley
Wailwan Aboriginal Digging Group	Phil Boney
Widescope	Steven Hickey
Gomeroy Cultural Consultants	Dave Horten
Aliera French Trading	Barry French

RAP field representatives involved in the field survey identified the following cultural values for the study area and surrounds in conversation with AECOM archaeologists:

- Mount Arthur is the dominant landscape feature in the local area and is a culturally significant landmark for Aboriginal people. Views of Mount Arthur are available from multiple viewpoints within the study area;
- an Aboriginal massacre site is located south of Mount Arthur (outside the study area) and is an important cultural historical site;
- the area south of Mount Arthur may have formed a bastion for dispossessed Aboriginal people during the contact period;
- an Aboriginal massacre site is located west of the study area near the Golden Highway (further information was requested about this matter, but was not provided);
- Mount Arthur burial is an important cultural site located north of the study area;
- Aboriginal people are known to have been employed on farms in the greater Jerrys Plains/Edderton area;
- the Hunter River gravels will have formed an important resource for Aboriginal people occupying the study area and its environs;
- the identification of long use-life tools during the current survey (i.e., axes) indicates that parts of the study area were likely to have been intensively occupied in the past;
- land within the study area, including identified sites, forms part of a much larger cultural landscape for the Wonnarua people;
- Saddlers Creek was likely a focal resource point for Aboriginal people occupying the greater Jerrys Plains/ Edderton area; and
- prior to European settlement, the native vegetation communities of the study area would have contained a variety of edible and otherwise useful plant species.

3.4 Stage 4 - Review of Draft Assessment Report

The aim of Stage 4 of the Consultation Requirements is to prepare and finalise an ACHAR with input from RAPs.

In accordance with Section 4.4.2 of the Consultation Requirements, all RAPs were sent a draft of this ACHAR on 18 November 2018 for review and comment (either by email or mail). A management meeting was held at the Maxwell Infrastructure site offices on 5 December 2018 with all RAPs invited to attend. The purpose of the management meeting was to discuss the findings of the assessment and proposed management recommendations. On 19 December 2018 attempts were made to phone all RAPs who had not provided comment. RAP responses are summarised in Table 4 with written and verbal responses attached as Appendix I.

A total of 12 responses were received supporting the assessment and management recommendations, one response not in support, three responses with no comment and 11 RAPs did not respond.

Table 4 RAP responses to draft ACHAR

Registered Aboriginal Party	Date	Method	Summary of response	AECOM response
Tocomwall Pty Ltd/ Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People (PCWP)	18-Nov-18	Email	Tocomwall responded with the following (18/11/18): <i>Tocomwall and the PCWP registered native title claimant group rejects the ACHAR. After a quick review of the document it appears that you or the proponent has not considered the finding against this mining lease before it was purchased by Maxwell. The PAC rejected the</i>	AECOM responded (21/12/18) with a letter requesting relevant cultural values be provided for the AHCAR as well

Registered Aboriginal Party	Date	Method	Summary of response	AECOM response
			<p><i>original heritage assessment conducted by AECOM and supported the confidential assessment conducted by Tocomwall and the upper hunters breeders association. As this document is controlled by The upper hunters Breeders association and Tocomwall, I will not be making that available to AECOM or your proponent</i></p> <p><i>Tocomwall responded (21/12/18) stating that they do not give licence and consent to RAPs assessing or making comment on the cultural values with in the registered native title claimed area. In addition, Tocomwall noted that several site cards have been lodged with AHIMS one of which covers the Maxwell Mining operations ELA. Furthermore, Tocomwall stated: Malabar has been involved in a section 29 notification under native title it is ridiculous for this company to now try and refuse to except who and which group is a traditional knowledge holder as described in the 2010 CCGL for proponents</i></p>	as a request to meet to discuss the PCWP's concerns with the ACHAR. The response also noted the PAC findings relevant to the Drayton South Assessment. Tocomwall declined to meet.

Wailan Aboriginal Digging Group	20-Dec-18	Email	No comments on the report	None required
Aliera French Trading	24-Jan-19	Email	Satisfied with the report	None required

4.0 Landscape Context

This section reviews the landscape context of the study area as a basis for predicting the character of past Aboriginal occupation within it and its associated archaeological record. Consideration of the landscape context of the study area is predicated on the now well established proposition that the nature and distribution of Aboriginal archaeological materials are closely connected to the environments in which they occur. Environmental variables such as topography, geology, hydrology and the composition of local floral and faunal communities will have played an important role in influencing how Aboriginal people moved within and utilised their respective Country. Amongst other things, these variables will have affected the availability of suitable campsites, drinking water, economic² plant and animal resources, and raw materials for the production of stone and organic implements. At the same time, an assessment of historical and contemporary land use activities, as well as geomorphic processes such as soil erosion and aggradation, is critical to understanding the formation and integrity of archaeological deposits, as well as any assessments of Aboriginal archaeological sensitivity.

4.1 Physical Setting

The study area for this assessment includes three spatially discrete parcels of land encompassing the proposed underground mining area, inclusive of a potential impact zone buffer, as well as land required for surface infrastructure (i.e., transport and services corridor, Edderton Road realignment, stockpile expansion, etc.)(Figure 2). Combined, these areas produce a study area of approximately 2,330 ha that extends south of the existing Maxwell Infrastructure as a thin transport and services corridor, expanding to a roughly circular area south of Saddlers Creek and north of the Hunter River. The majority of land within the study area has historically, been used for grazing.

Reference to the Geographical Name Register (GNR) of NSW indicates that the study area falls wholly within the boundaries of the Muswellbrook Shire Council LGA and is situated within the Parish of Wynn in the County of Durham. Surrounding suburbs include Edderton to the north, Jerrys Plains to the south, Howick to the east and Denman to the west.

4.2 Topography

The study area is located approximately 10 km south-southwest of the town of Muswellbrook within Central Lowlands of the Hunter Valley (Story, Galloway, van de Graaf, & Tweedie 1963). Its topography consists principally of flats interspersed with low undulating to steeply sloped hills, ridges and crests over open farmland which is typical of the region. Slopes range from level and gently inclined on alluvial flats that generally border Saddlers and Saltwater Creeks, to steeper slopes on hills in the central and southern portions of the study area.

Elevations across the study area range from approximately 110 metres (m) Australian Height Datum (AHD) to 270 m AHD, providing a total local relief of 160 m (Figure 4). Following Speight (2009), a breakdown of the relative representation of morphological landform units within the study area is provided in Table 5. Identified landform units, meanwhile, are shown on Figure 5.

²i.e., edible and/or otherwise useful (e.g., medicine, clothing).

Table 5 Morphological landform units within the study area

Landform unit	Area (ha)	%
Disturbed	39.07	1.7
Lower	714.01	30.6
Middle	707.27	30.4
Upper	314.80	13.5
Crest	316.42	13.6
Flat	238.74	10.2
Total	2330.31	100

4.3 Hydrology

The study area is located within the Hunter River catchment, with the Hunter River located around 360 m from the study area's southern boundary. The Hunter River is the most significant watercourse in the Hunter Valley Region, and in the area near the study area generally flows in westerly direction through a channel approximately 30 m wide and approximately 3-6 m deep. The Hunter River cuts across a well-developed floodplain, which can be up to several kilometres wide at its widest point.

The principal watercourse associated with the study area is Saddlers Creek which is located on the northern boundary of the study area. This creek is 4th order to the north of the underground mining area and 5th order downstream of Edderton Road. Saddlers Creek is fed by a number of small ephemeral creeks and drainage lines that traverse the central and northern portions of the study area. These creeks and drainage lines form complex drainage networks that comprise the central reaches of the Saddlers Creek catchment area. Dry for much of the year, these watercourses commonly flow after large rain events, and as a result, will flood Saddlers Creek. The watercourses vary in width from less than a metre at their headwaters to instances of greater than 20 m where they meet Saddlers Creek. Many of the watercourses, including Saddlers Creek, show evidence of heavy erosion associated with historic native vegetation clearance activities, particularly along their mid and lower reaches.

In the eastern portion of the study area, another series of ephemeral creeks and drainage lines drain moderately to steep sloped hills before feeding into Saltwater Creek, a 5th order creekline immediately upstream of the Hunter River and also located outside the study area. As with watercourses feeding Saddlers Creek, these feeder creeks are mostly dry, running only during rain and flood events. Heavy erosion is likewise a feature, particularly along the middle to lower reaches, with transported soils draining to the Saltwater Creek floodplain. Plashett Reservoir, constructed to supply water to the nearby Bayswater Power Station and the Jerrys Plains township, occupies a large portion of the original alignment of Saltwater Creek. Both Plashett Reservoir and Bayswater Power Station are outside the eastern extent of the study area.

4.4 Geology

Reference to the Singleton 1:250,000 geological mapsheet (Singleton 1:250,000 Geological Series Sheet SI 56-1) indicates that the surface geology of the study area comprises two distinct formations: Quaternary alluvial deposits and Permian coal measures, of which the Singleton Supergroup (formerly known as the Singleton Coal Measures) comprises the overwhelming majority. Quaternary alluvial deposits are associated with Saddlers and Saltwater Creeks, and the Hunter River, and comprise gravels, sand, silt and clays derived from Permian shales and sandstones. The Singleton Supergroup incorporates several geological sub-groups including the Newcastle Coal Measures, Tomago Coal Measures, Watts Sandstone and the Wittingham Coal Measures. Lithic materials associated with the Singleton Supergroup include coal seams, claystone, siltstone, sandstone, conglomerate, tuff, and shale.

Two geological features of note are associated with the study area and are likely to have had a direct bearing on the nature and composition of any Aboriginal stone assemblages found within it: the Hunter River Gravels, and two identified sources of silcrete and tuff cobbles (one within and one nearby the study area). The Hunter River Gravels are a well-known source of indurated mudstone, often referred to as tuff (see Hughes et al. 2011 for a discussion), silcrete, and quartz raw material that was utilised by Aboriginal people in the manufacture of stone tools in the Central Lowlands. The gravels are exposed at numerous locations along the Hunter River, both as active gravel bars within the creek channel and on former terraces. Gravel locations have been noted at Muswellbrook, Denman, Jerrys Plains and Singleton (Dean-Jones & Mitchell 1993). However, as Esteves (1999) has suggested, when discussing the location of these gravels it is important to note that the Hunter River's alignment is considerably different today than it was prior to European settlement. This is due to channel modifications, land management practices, and natural processes, the implication being that the Hunter River gravels may be located adjacent to old channelisation at a considerable distance from its current channel. In addition, current gravel exposures may not necessarily have been accessible to Aboriginal people in the past.

In an assessment of several Hunter River gravel bars MacDonald & Davidson (1998) found that the bars consist primarily of local materials, reflecting the River's underlying geology, and smaller deposits of non-local material transported from other parts of the system. Both indurated mudstone/tuff and silcrete are considered locally derived; indurated mudstone/tuff being part of the Singleton Supergroup, and silcrete being derived from Tertiary fluvial sands and gravels. Surveys undertaken by Esteves (1999) along the Hunter River concluded that while these raw materials are present throughout the Hunter River gravel bars, there is spatial variability in their availability.

Naturally occurring outcrops of silcrete cobbles have been identified at two confirmed locations in the local area, one within the study area and another 2.7 km to the west. Both these natural outcrops of silcrete show evidence of exploitation and would have been a source of raw material for stone tool production and are an important factor in characterising the local archaeology.

4.5 Soils

Reference to the 1:250,000 Singleton Soil Landscape Series Sheet (SI 56-1) (Kovac & Lawrie 1991) indicates that soils within the study area form part of the Brays Hill, Bayswater and Liddell soil landscapes. The Brays Hill soil landscape is characterised by red clays (*Vertosol*) on the mid-slopes, black earths on steeper slopes and grey and brown clays (*Vertosols*) with linear gilgai (small ephemeral water bodies) and yellow solodic soils (soils with a strong texture contrast between the A and B horizon and a bleached A2 horizon) (*Sodosols*) on some lower slopes. The crests and upper slopes are characterised by red-brown earths (*Chromosols and Dermosols*) and alluvial soils are present in drainage lines. Soil erodibility varies from low to moderate throughout the soil landscape, although Alluvial subsoils have a high level of erodibility (Environmental Earth Sciences NSW 2012). Soils on cleared hillslopes are susceptible to minor sheet erosion and drainage lines may have moderate gullying. Potential for mass movement of soils is moderate to low (Kovac & Lawrie 1991). Both erosion and mass movement of soils are factors that potentially contribute to disturbance of archaeological sites.

The Bayswater soil landscape is characterised by yellow solodic soils (*Sodosols*) on slopes with alluvial soils in drainage lines. Within this landscape grouping, yellow solodic soils and red-brown earth (*Chromosols and Dermosols*) intergrades also occur. Brown and yellow earths and prairie soils (a soil type occurring in temperate areas formerly under prairie grasses and characterised by a black A horizon) are present in some drainage lines. Soils on slopes also comprise yellow and brown podzolic soils (*Chromosols*) (Environmental Earth Sciences NSW 2012). Moderate sheet and gully erosion is common on slopes (Kovac & Lawrie 1991). As a result, archaeological sites present on slopes may have been subject to varying degrees of disturbance.

The Liddell landscape grouping is generally duplex in character with varying degrees of change between A and B horizons. Lower-slopes are comprised of Yellow Solodic Soils, which consist of weakly structured dark brown loam A₁ horizons over bleached orange clay loam A₂ horizons. Below these, a clearly changed soil profile of blocky bright reddish-brown light clay, becoming more yellow at depth is located. Mid-slopes are comprised of Earthy/Siliceous Sands, which consist of brown sand/loamy sand to brown sandy loams, gradually changing to dull yellow-brown sandy loam or bright brown loamy sand in the B horizon. Upper-slopes are comprised of Yellow Soloths, which consist of Brown loamy sand to sandy loam over a bleached light grey/yellow orange sandy loam or sandy clay loam, clearly changing to bright brown/dull orange sandy clay in the B horizon (Environmental Earth Sciences NSW 2012). Soils on the lower and upper-slopes (Soloths and Solodics) are susceptible to moderate to high erosion, particularly sheet, gully and, to a lesser extent, rill erosion. Soils on the mid-slopes (sands) have a low potential for erosion. Mass movement hazard is low throughout the soil landscape (Kovac & Lawrie 1991). In these contexts, archaeological sites may be well preserved.

A large number of archaeological sites within the Hunter Valley occur within texture contrast (duplex) soils (Hughes 1984, Koettig & Hughes 1985). Texture contrast soils, as defined by Hughes (1984), consist of an A horizon of massive, sandy to silty material overlaying a B horizon of clayey material with a blocky structure. These soils are prevalent in the Central Lowlands and mantle the undulating to hilly landscapes on Permian and Carboniferous rocks and the older alluvial terraces and valley fills (Hughes 1984). Archaeological excavations in the Hunter Valley have consistently shown Bondaian assemblages, dated to the late Holocene, associated with the A soil horizon. This result has led Hughes and others to conclude that soil materials that make up the A horizon are sedimentary in origin and have accumulated over the last 5,000 years (Hughes 1984).

Texture contrast soils (particularly the A horizon, due to its loose sandy and silty material) are prone to extensive erosion resulting in the exposure and subsequent disturbance of subsurface archaeological deposit in its original context. During excavations in the study area in the mid-1980s, Hughes (1984) noted that sheet erosion was the dominant erosional process in the area, resulting in the partial stripping of A horizon soils, with only a little deep rilling and gullying of the underlying B unit.

As in other parts of the Hunter Valley, existing archaeological, environmental and historic reference materials for the study area suggest that a range of geomorphic processes are likely to have affected the Aboriginal archaeological record of the site. Potentially significant phenomena from an archaeological perspective include bioturbation, erosion, alluvial/colluvial aggradation and aeolian processes. Possible effects of these processes include:

- increased archaeological site visibility in eroded areas;
- reduced archaeological site visibility in areas of sediment deposition;
- horizontal and vertical translocation of artefacts;
- stratigraphic mixing;
- truncation of archaeological deposits; and
- creation of thicker (potentially stratified) archaeological deposits in floodplain, slope base and fluvial/aeolian sand deposit contexts.

Figure 5 Landform & Hydrology

Figure 6 Surface Geology

Figure 7 Soil Landscapes

4.6 Flora & Fauna

Native vegetation within the study area has been significantly modified as a result of historic European land use practices with the current vegetation providing insight into the pre-European settlement floral regime of the site. In general, the study area supports a diverse range of natural vegetation communities, with different communities occupying different landscape positions.

Current vegetation across the study area comprises patches of Dry Sclerophyll Forest, Forested Wetlands, Grassy Woodlands and native derived grassland (Hunter Eco 2019) with forest and woodland typically found in gully and riparian areas that have historically been difficult to farm. These vegetated areas are large enough to provide reasonable interior habitat for native fauna and flora and these areas support a diversity of species in the understorey.

The flora assessment completed by Hunter Eco (2019) for the Project indicates that Dry Sclerophyll Forest in the study area is dominated by White Box, Narrow-leaved Ironbark, Blakely's Red Gum shrubby open forest commonly found in the central and upper Hunter Valley. Slaty Box and Grey Gum shrubby woodland are also present, to a lesser extent, in the western portion of the study area. Forested Wetland comprising Swamp Oak Forest is also mapped in small patches in the western portion of the study area.

Native derived grassland in the study area, typically located between patches of forest and woodland, is largely dominated by a variety of native perennial grass and forb species but many exotic species are also present as is typical of grazing lands (Cumberland Ecology 2012).

A total of 201 fauna species were recorded in the study area during the surveys comprising 10 amphibian, 22 reptile, 131 bird and 38 mammal species (Future Ecology 2019) suggesting a diverse range of faunal resources were available for exploitation by Aboriginal people. A suite of bird species, and to a lesser extent, bats, dominates the faunal assemblage within the study area. Arboreal mammals were restricted to common and disturbance-adapted species such as possums. Small ground dwelling native fauna (mammals, reptiles and amphibians) are not as well represented within the study area. These trends may reflect the high degree of modification to the understorey habitat and general lack of forage and shelter, as well as the fragmented nature of woodland that may restrict movement.

Although available historical records provide only limited insight into Aboriginal exploitation of plants within the Hunter Valley (Brayshaw 1987: 74), it can be confidently asserted that the original vegetation communities of the study area will have supplied Aboriginal people camping within, and passing through the site, with an extensive array of edible and otherwise useful plant species. Recorded native vegetation communities and locally occurring wetland will likewise have supported a large and diverse range of economic terrestrial, aquatic and avian fauna. Historical evidence for the Aboriginal exploitation of faunal and floral resources within the Hunter Valley is discussed in further detail in Section 5.3.

4.7 Historical Context

The Hunter region was initially identified as an area of rich resources in 1797 when Lieutenant John Shortland found coal at the mouth of the Hunter's River, as it was then known. A convict settlement was established at the mouth of the River in 1801 to gather coal and timber and burn shells for lime (Hunter 2010: 6).

The 1810s saw increased pressure on land around Sydney, especially following several years of drought. The farmers on the Hawkesbury River around Windsor petitioned Governor Macquarie to allow exploration inland. In 1819, Macquarie authorised men to find an overland route into what is now the Hunter Valley. The leader of this party, Windsor chief constable John Howe, exclaimed it was the best pasture he had seen since leaving England. Confirmation of the overland route was undertaken in 1820 (Hunter 2010:7). Macquarie rewarded the men in this second party with land grants around the area now known as Singleton.

Land was quickly surveyed and by 1823 grants along rivers and creeks had been issued. Settlement, however, seems to have been made at a slower pace. A traveller in 1827 said that the area was inhabited by single shepherds with their flocks (Hunter 2010:8).

In 1829, Jerrys Plains was surveyed as a town, although it had been a campsite for travellers for some years previous. The town was not proclaimed until 1840 and official grants were not given until several years later. Despite the absence of official land ownership, development of the town continued.

Muswellbrook was proclaimed in 1833, although again, there had been earlier settlement in the vicinity. The surrounding area was largely used for grazing and cropping, with an increasing focus on dairying. Coal mining began in the 1890s but did not become prolific until more recently.

Reference to Nineteenth Century parish maps for Wynn indicates that the eastern portion of the study area was originally part of the Plashett Estate, first granted to James Robertson. Plashett was granted to James Robertson, of Renfrew, Scotland, in 1827. Robertson had arrived in the colony in 1822 accompanied by his wife, Anna Maria and six children. In London, Robertson had been a watch and mathematical instrument maker for Grimaldi and Johnson of The Strand. In this capacity, Robertson had made friends with Thomas Brisbane, who was a keen astronomer. When Brisbane was appointed Governor of NSW he encouraged Robertson to immigrate to the colony.

A map of the Hunter River Land Grants produced in October 1829, shows the Robertson 1,000 acres with a house built on it. This house is thought to be the slab cottage which remained standing until 1993, when it was reportedly demolished. On 15 September 1854, Plashett was advertised for sale in the Maitland Mercury, and was described as being "*an excellent Stone House, not finished inside, which was located near to where the old homestead stood.*" Plashett was purchased from Robertson in November 1854 by Joseph Pearse, who in turn transferred ownership to his son William Pearse in 1864. William Pearse married Catherine Langley in 1866. By the 1890s, the property was supplying sheep and cattle for both Sydney and Hunter Valley abattoirs. Cattle were sent to the Hunter from the Pearse properties in Queensland to be fattened up for the Sydney market. Corn, horse breeding, and shearing also took place at the property. By 1910, Plashett was producing milk from a herd of approximately 100 cows for the Jerrys Plains butter factory.

When William Pearse died in 1927, a probate valuation describes the property as pastoral, with 18 grazing paddocks, three for cultivation, and a few others as well. Timber had been left in the paddocks to provide shade for the cattle, and this included kurrajong and box species.

Plashett remained in the Pearse family for 117 years, until 1971, when a portion of the property was transferred to Caroon Pty Ltd. In 1982, this portion was transferred to the Electricity Commission of New South Wales (Pacific Power). In that same year, Lot 2 DP 616024, which comprised half of the land owned by Pacific Power, was transferred to Mount Arthur Coal Pty Ltd. In 2000 the property was purchased by Anglo American plc. Plashett remains a pastoral property, now managed on behalf of Malabar.

The Wynn parish map indicates that the western portion of the study area was originally part of a 2,560 acre land grant to George Bowman and was part of the historic Arrowfield estate. The property was subsequently purchased by a Mr Ryder, and Edderton Homestead was then built in 1908. Ryder named the property after the Edderton Meat Works in Brisbane, one of his business interests. It was then acquired by a Mr Osborne.

The property was acquired by the McDonald family c. 1910 and increased in acreage. It was purchased by Hector Cameron McDonald and then passed on to his son Douglas. When first purchased by McDonald, the property was approximately 4,000 acres. Over a period of 25 years, McDonald consolidated Edderton with other lands into a large pastoral property, increasing it to about 13,000 acres. Originally, McDonald ran about 16,000 sheep and today a six stand galvanised iron shearing shed remains, together with the old shearers' quarters. After some time, sheep were replaced by cattle as a result of the damage caused to the land. The homestead was extended by the McDonalds from its original four rooms. The building is of quite unusual detail and is in excellent condition. Following WWII, the Edderton property steadily became less economically viable and was gradually broken up. Edderton has since been acquired by Mount Arthur Coal Pty Ltd, a subsidiary of BHP, and is currently leased as a working pastoral property primarily for cattle grazing.

4.8 Land Use

The current dominant land uses within the study area is cattle/sheep grazing and limited cropping as well as mining in the north. Since European settlement of the area in the 1820s, the flora and fauna, hydrology regimes and general landform have been subject to considerable modification as a result of European agricultural activities.

Together with available documentary sources and field observations, historical aerial photographs provide a framework for assessing the nature and extent of previous land disturbance across the study area. Examination of aerial photographs from 1958 (Figure 8), 1967 (Figure 9), 1974 (Figure 10), 1989 (Figure 11), 1998 (Figure 12), and 2009 (Figure 13), provided below, attest to a range of land use activities and associated ground surface impacts across the site including:

- extensive native vegetation clearance (prior to 1958);
- pastoral activities including livestock grazing, fencing, the construction of multiple farm dams and contour banks for erosion control;
- fluvial erosion activity, particularly along creeklines and on cleared hillslopes;
- construction of residential dwellings and associated structures, driveways and access tracks;
- construction of essential services including power lines and roads (e.g., Edderton Road); and
- construction of the existing Maxwell Infrastructure complex and associated coal mining activities in the mining lease areas and minor excavation for exploratory drilling activities in the exploration licence area.

To varying degrees, all the above-cited land use activities and associated ground impacts are relevant to the survival, integrity and identification of Aboriginal archaeological evidence within the study area. Key implications for the current assessment include:

- the likely destruction, in areas of grossly modified terrain, of any pre-existing sites and deposit(s);
- the disturbance of pre-existing archaeological deposits through both direct (e.g., ploughing, bulldozing) and indirect (e.g., erosion) means, resulting in a loss of archaeological integrity;
- the likely removal of any culturally scarred trees that once existed within the study area; and
- an increase, in areas affected by erosion, of archaeological site visibility.

A disturbance map combining these various ground surface impacts is provided as Figure 14. Levels of disturbance are defined as:

- **High** - Severe disturbance to natural soil profiles including complete-to-near complete topsoil loss through erosion, earthworks, buildings, vehicle tracks and dams; and
- **Low** - Cleared and/or grazed at some time.

Figure 13 2009 aerial photograph of the study area (Source: Land & Property Information NSW)

Figure 14 Disturbance Mapping

4.9 Key Observations

Key observations to be drawn from a review of the existing environment of the study area are as follows:

- The topography of the study area consists principally of flats interspersed with low undulating to steeply sloping hills, ridges and crests over open farmland which is typical of the region. Slopes range from level and gently inclined on alluvial flats that border both Saddlers and Saltwater Creeks to steeper slopes on hills in the central and southern portions of the study area.
- The principal watercourse associated with the study area is Saddlers Creek, a 5th order creekline located outside the study area on its northern boundary. While not located within the study area, Saddlers Creek is fed by a number of small ephemeral creeks and drainage lines that traverse its central and northern portions. These creeks and drainage lines form complex drainage networks that comprise the central reaches of the Saddlers Creek catchment area.
- Reference to the Singleton 1:250,000 geological mapsheet indicates that the surface geology of the study area comprises two distinct formations: Quaternary alluvial deposits and Permian coal measures, of which the Singleton Supergroup (formerly known as the Singleton Coal Measures) comprises the overwhelming majority.
- Two geological features of note are associated with the study area and are likely to have had a direct bearing on the nature and composition of Aboriginal stone assemblages within it: the Hunter River Gravels, and two identified sources of silcrete cobbles, one within the study area and another 2.7 km to the west.
- Prior to European settlement, the floral and faunal resources of the study area and environs will have been sufficient to facilitate intensive and/or repeated occupation by Aboriginal people.
- Examination of historical aerial imagery for the study area indicates a range of historical land use activities and associated ground surface impacts. Major activities/impacts include native vegetation clearance, the construction of farm dams and erosion. However, the majority of land within the study area retains moderate integrity.

5.0 Ethnohistoric Context

5.1 Introduction

Information regarding the ways in which Aboriginal people likely used pre-contact landscapes is available to archaeologists through two primary sources: archaeological (i.e., survey and excavation) data and historical records. Section 6.0 summarises the Aboriginal archaeological context of the study area on both a regional and local scale. This section builds on this foundation by summarising relevant ethnohistoric information for the study area and environs. Further information is also provided in the CVR (Appendix A).

As in other parts of New South Wales and Australia more broadly, non-Aboriginal people occupying the Upper Hunter Valley began to document Aboriginal culture from first contact, with explorers, missionaries, settlers and the like recording their observations of Aboriginal people and/or their material culture in letters, journals and official reports. Many of these accounts are overtly Eurocentric in tone and the content and veracity of some is, at best, questionable. Nonetheless, taken together, they form an important source of information on Aboriginal lifeways at the time of British colonisation and can, in conjunction with available archaeological data, be used to generate working predictive models of prehistoric Aboriginal land use.

Key sources, both primary and secondary, for the post-contact languages and lifeways of the Aboriginal people occupying the Hunter Valley at the time of contact include: Backhouse (1843), Barrallier (1802), Brayshaw (1987), Caswell (1841), Capell (1970), Dawson (1830), Ebsworth (1826), Enright (1900, 1901, 1932, 1933, 1936, 1937), Elkin (1932), Fawcett (1898a, 1898b), Ford (2010), Gunson (1974), Hale (1846), Fraser (1892), Haslam et al. (1984), Larmer (1898), Lissarrague (2006), Matthews (1898, 1903), Miller (1887), McKiernan (1911), Threlkeld (1827, 1834, 1836, 1850), Scott (1929) and Sokoloff (1980). Although a detailed review of these sources is beyond the scope of this report, information of particular relevance to the current assessment is summarised below.

5.1.1 Language Groups and Boundaries

As highlighted by Brayshaw (1987) and a number of other researchers (e.g., ERM 2004; Kuskie 2000a), reconstructing the social and territorial organisation of the Aboriginal groups occupying the Hunter Valley at contact is extremely difficult given the enormous social upheaval that preceded any formal investigations into their languages and lifeways. The sometimes contradictory nature of primary historical records has likewise complicated the situation as has the tendency of early observers to describe all named groups of Aboriginal people, regardless of size and/or composition, as 'tribes' (Brayshaw 1987: 36).

According to Tindale's (1974) oft-cited tribal map, the current study area is located within Wonnarua territory, close to the boundary with the Geawegal (Figure 15). Tindale (1974) describes the territory of the Wonnarua as a 5,200 square kilometres (km²) area stretching from "a few miles" north of Maitland west to the Dividing Range and south to the divide north of Wollombi. To the south of the Wonnarua, Tindale (1974) places the Darkinjung, whose tribal territory is described as a 4,700 km² area extending south of the Hunter River watershed, from "well south" of Jerrys Plains, east toward Wollombi and Cessnock, south to Wisemans Ferry on the Hawkesbury River, and west to the divide east of Rylstone. To the west of the Wonnarua were the Wiradjuri, one of the largest groups in NSW occupying an area of 97,100 km² extending from the Lachlan River to Rylstone and Mudgee. To the east of the Wonnarua were the Worimi and Awabakal. The Worimi, according to Tindale (1974), occupied a 3,900 km² area extending from the Hunter River to Forster, near Cape Hawke, inland to near Gresford and south to Maitland, while he describes the Awabakal as occupying a 1,800 km² area centred on Lake Macquarie, south of Newcastle. Finally, to the north of the Wonnarua, Tindale (1974) places the Geawegal tribe, who are described as occupying the northern tributaries of the Hunter River to Murrurundi and being present at Muswellbrook, Aberdeen, Scone and the Mount Royal Range.

Although widely cited, it should be noted that Tindale's boundaries for the Awabakal 'tribe' do not accord with those provided by the missionary Reverend Lancelot Threlkeld, who established an Aboriginal mission at Belmont on Lake Macquarie in 1826³ (the 'Bahtahbah' mission) and is widely regarded as one of the pioneers of Aboriginal studies in New South Wales owing to his detailed recordings, with the assistance of influential Awabakal leader Biraban (aka John McGill), of the language and lifeways of the Aboriginal people occupying the Hunter River Estuary.

Writing in 1828, for example, Threlkeld described the territory of the Awabakal as consisting of:

"The land bounded (to the South) by Reid's Mistake the entrance to Lake Macquarie, (to the North) by Newcastle & Hunter's River, (to the West) by five islands on the head of Lake Macquarie 10 miles west of our station. This boundary, about 14 miles N and S by 13 E and W, is considered as their own land" (Threlkeld 1828 in Ford, 2010: 339) (Figure 16)

Tindale's (1974) and Threlkeld's (1828) contradictory accounts notwithstanding, what is clear from available historical records is that the former's oft-cited division of the Awabakal and Wonnarua into two separate 'tribes' does not adequately capture what was at contact a complex system of social and territorial organisation involving numerous local descent groups (i.e., clans) and bands who, critically, spoke the same language. As Lissarrague (2006: 7) has recently observed, "the evidence from archival sources suggests that the language described by Threlkeld as 'The language of the Hunter River and Lake Macquarie' was spoken by people now known as Awabakal, Kuringgai and Wonnarua". Lissarrague (2006), for her part, has named this language the Hunter River and Lake Macquarie language (HRLM language) and notes that it may also have been spoken by Tindale's (1974) Geawegal 'tribe'.

Figure 15 Excerpt from Tindale's (1974) tribal map (Tindale, 1974)

³ Subsequently relocated to Toronto in 1831 and named 'Ebenezer' mission

Critical to current interpretations of the boundaries of the HRLM language are the observations of Reverend Threlkeld. Threlkeld’s own account of the boundaries of this language, which comes from his 1838 report to the then NSW Legislative Council’s Committee on the Aborigines Question, is reproduced below:

“The native languages throughout New South Wales, are, I feel persuaded, based upon the same origin; but I have found the dialects of various tribes differ from those which occupy the country around Lake Macquarie; that is to say, of those tribes occupying the limits bounded by North Head of Port Jackson, on the south, and Hunter’s River on the north, and extending inland about sixty miles, all of which speak the same dialect.

The native of Port Stephen’s use a dialect a little different, but not so much so as to prevent our understanding one another’ but at Patrick’s Plains the difference is so great, that we cannot communicate with each other; there are blacks who speak both dialects” (Threlkeld 1838 in Ford, 2010).

Threlkeld’s (1825 in Ford, 2010: 328) earlier observation that “the natives here [i.e., at Lake Macquarie] are connected in a kind of circle extending to the Hawkesbury and Port Stephens” is also worthy of note here.

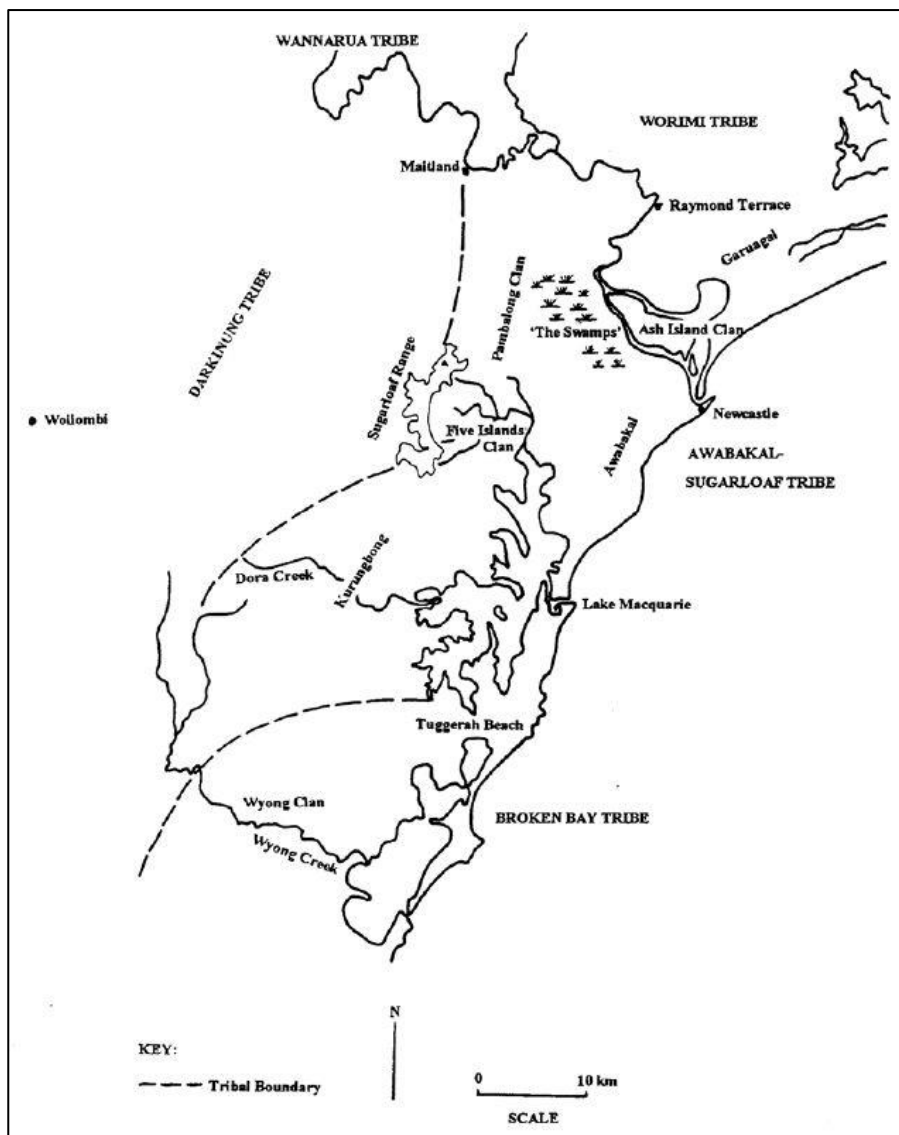

Figure 16 Gunson’s (1974) tribal map for the lower Hunter Valley, based on the observations of Reverend Lancelot Threlkeld (from Kuskie, 2012: 39, Fig. 8, after Gunson, 1974)

Threlkeld's observations provide strong *primary* evidence for the existence of a single shared language for Tindale's (1974) Awabakal and Wonnarua 'tribes'. At the same time, they suggest that this language differed from that spoken by the Worimi around Port Stephens, being the Kutthung or Kattang language described by Enright (1900, 1901), and those spoken by Aboriginal groups occupying the Middle and Upper Hunter Valley, namely Darkinjung and Kamilaroi (Brayshaw 1987; Ford, 2010). Although Threlkeld's proposed southern extent for the HRLM language does not accord with the observations of other early sources, principally R.H. Matthews, his suggestion of a single shared language for the Aboriginal groups occupying the catchments between the Hawkesbury River estuary of Broken Bay and the estuarine areas of the Lower Hunter River is well supported by available historical records and associated linguistic research (see, in particular, Capell 1970; Ford 2010).

Ford's (2010) recently completed historiographic analysis provides further insight into the social and territorial organisation of the Aboriginal groups occupying the Hunter Valley at contact. Based on his own detailed review of available historical records, Ford (2010) has argued that the actual 'tribal' and/or language name for the HRLM-speaking Aboriginal groups occupying the estuarine areas of the lower Hunter River at contact was *Wannungine* and not Awabakal, with the latter term coined, alongside *Guringai* (now *Kuringgai*), by Scottish ex-school teacher and Maitland resident John Fraser in 1892 (Fraser 1892).

The term *Wannungine*, Ford (2010: 343) notes, was the term that celebrated surveyor and self-taught anthropologist R.H. Matthews recorded as the language or tribal name for Aboriginal peoples occupying the coastline southward from the Hunter River estuary to 'Lane Cove', but not extending to the north shore of Port Jackson, and east to the coastal range⁴. Matthews also identified the term *Wannerawa*, applying it to the southern part of the identified Wannungine area (i.e., around Broken Bay) (Ford 2010: 344).

Thus, although correctly identified by Matthews, it is Ford's contention that Miller's (1887) misapplication of the term *Wannerawa*, as *Wonnarua*, to the Middle and Upper Hunter Valley, an error subsequently reinforced through the publications of disgraced journalist J.W. Fawcett (1898a, 1898b), that has resulted in the historical anomaly of the *Wannerawa* (Miller's (1887) 'Wonnarua') being placed in the Middle and Upper Hunter. Miller's (1887: 352) reference to the principal ornament of the Wonnarua being a "nautilus shell cut into an oval shape and suspended from the neck" is cited as further evidence that Miller should actually have meant the Wonnarua to be coastal people (Ford, 2010: 354). Contrary to Miller's (1887) and Fawcett's (1898a, 1898b) widely cited accounts, Ford's research suggests that at the time of first European settlement, the mid Hunter was, in fact, occupied by Darkinjung-speaking peoples, whose territory encompassed the ranges bounded by the Hawkesbury River floodplain to the south and the Hunter River floodplain to the north and was bordered to the east-northeast by the coastal *Wannungine* (aka *Wannerawa*) (Ford, 2010: 10). Bordering the Darkinjung to the west/northwest, in the Upper Hunter, were Kamilaroi-speaking peoples, who Ford (2010: 467) suggests had penetrated over the Liverpool Range and were occupying the Hunter Valley as early as 1819.

As to the name of the group occupying the study area at the time of contact, available sources are unclear. Reference to historic documents suggest four named groups occupied the area referred to as Patricks Plains, an area surrounding Singleton, including the 'Plains clan', the Bulcara, the Micarrawillang, and the Kinkigyne (or Hungary Hill) (Colonial Secretary Letters 1829 [4/2045]). The Return of Aboriginal Natives dated 2nd June 1834 (4/22191.1, Reel 3706, Slide 0186) indicates that the Kinkigyne occupied the Fal Brook area near Singleton. It is unclear what part of Patricks Plains the remaining groups occupied. Further west it is noted that Edward Ogilvie of the Merton property (near Denman) suggested four groups occupied this area including the Marawancal, the Tooloom-pikilal, the Gundical and the Panin-pikilal (Wood 1972). Returning to the study area, it's possible that this area occupied an interface between the Patricks Plains district groups and the Merton district groups. Further discussion is provided in the CVR (Appendix A).

⁴ From north to south: the Sugarloaf Range, the Watagan Range and Peats Ridge.

5.2 Social Organisation

In common with other regions of New South Wales (e.g., Attenbrow 2010) and Australia more broadly (Peterson 1976), available historical records suggest that the primary units of social organisation amongst the Aboriginal language groups present in the Hunter Valley at contact were the clan and band. Although these terms are often used interchangeably (e.g., Kohen 1993), following Attenbrow (2010), a distinction can, in fact, be drawn between the two, with clans comprising local descent groups and bands, land-using groups who, though not necessarily all of the same clan⁵, camped together and cooperated daily in hunting, fishing and gathering activities. Individual bands will have habitually occupied and exploited the resources of particular tracts of land within the overall territory of their clan. However, the territorial boundaries of each band will have been permeable or elastic in the sense of complex kinship ties facilitating inter-band territorial movements and the reciprocal use and/or exchange of resources (Brayshaw 1987: 36).

The size of the individual bands occupying the Hunter Valley at contact appears to have varied considerably and was no doubt activity and season dependent (Brayshaw 1987). However, an upper limit of around 70 individuals, consisting of several families, is suggested by available historical records (see, in particular, Table B in Brayshaw 1987). Individual band sizes notwithstanding, much larger groups of Aboriginal people, numbering in the hundreds, are known to have come together for events such as corroborees, ritual combats and feasts (e.g., Anon 1877a; Scott 1929: 32; Threlkeld in Gunson 1974: 55).

Fawcett (1898b) notes the existence of four exogamous clans amongst the Wonnarua, with different clan names for men and women:

“The Wonnah-ruah tribe, like most other tribes, was divided into four classes or clans, and the laws of consanguinity, which existed in this tribe, as other tribes, effectually barred a man’s marriage with the women of his own class or clan and also with the class or clan of his mother. Every man in the Wonnah-ruah tribe was either an Ippye (Ipai), a Kumbo, a Murree (Murri), or a Kubbee (Kubbi); and every women an Ippatha (Ipatha), a Butha, a Matha or a Kubbeetha (Kubbitha)” (Fawcett, 1898b: 180).

5.3 Settlement and Subsistence

Available historical records attest to exploitation, for food and other resources (e.g., skins for clothing), of a large and diverse range of terrestrial, avian and aquatic fauna by Aboriginal peoples occupying the Hunter Valley at contact. A broad economic division between ‘coastal’ and ‘inland’ groups is also evidenced, with the subsistence regimes of those living along the coast geared principally towards the exploitation of marine foods and those of inland groups based chiefly on the exploitation of land mammals (e.g., Ebsworth 1826: 80).

The diet of inland Aboriginal groups occupying the Hunter Valley at contact consisted of a variety of freshwater animal foods, with kangaroos, wallabies, bandicoots, echidnas, possums, flying foxes, kangaroo-rats, koalas, dingos, lizards, goannas and snakes variously reported as having been hunted and/or eaten (see Brayshaw 1987; Haslam et al. 1984 and Sokoloff 1980 for primary references). Various species of freshwater and estuarine fish, eels and mussels were also consumed, as were turtles (e.g., Anon 1877b; Cunningham 1828: 151; Grant 1803: 61). Possums appear to have been a favoured food, particularly in inland areas, with a number of early accounts detailing their method of capture and remarking on the tree climbing skills of the Aboriginal people involved (e.g., Dawson 1830: 238; Scott 1929: 21). Flying foxes, too, appear to have been actively sought out by groups in both areas (e.g., Anon 1877a; Scott 1929: 23), though not by the Awabakal at Lake Macquarie who held the animal in high esteem (Threlkeld in Gunson 1974: 206). Macropods were sometimes stalked and speared by individual huntsmen (Dawson 1830: 216; Threlkeld in Gunson 1974: 190). However, their capture was more commonly a communal exercise (Dawson 1830: 182; Scott 1929: 20; Threlkeld in Gunson 1974: 191). Threlkeld (in Gunson 1974: 206) and Fawcett (1898a: 153) report the burning off of particular tracts of land to promote new growth and attract kangaroos and wallabies.

⁵ Some individuals may have been related through marriage.

References to the hunting and consumption of a variety of birds, including the emu, are also present in the writings of a number of early observers (e.g., Fawcett 1898a; Scott 1929: 23; Threlkeld in Gunson 1974: 55, 65). Fawcett (1898a: 153) reports the use of nets to trap emus and use of returning boomerangs to bring down “ducks and other birds”. Larvae, namely ‘Cabra’ or shipworm (*Teredo navalis*) and other tree dwelling grubs, appear to have been a popular foodstuff in both coastal and inland areas (Anon 1877b; Scott 1929: 21-22). Honey collected from the hives of native bees was both eaten directly and mixed with water to form a sweetened drink (Breton 1833: 195; Dawson 1830: 60; Scott 1929: 34-35; Threlkeld in Gunson 1974: 67, 124).

Compared with their faunal counterparts, the plant food resources of coastal and inland groups are poorly represented in the writings of early colonial observers. Nonetheless, available descriptions do suggest that plants formed a regular part of the diets of groups in both areas. Fern roots, likely those of the bracken fern (*Pteridium esculentum*) and various water ferns (*Blenchum spp.*), appear to have played an important role in the diets of those Aboriginal people occupying the estuarine reaches of the Hunter River (Barrallier 1802: 81-82; Dawson 1830: 92; Ebsworth 1826: 71; Threlkeld in Gunson 1974: 19). Other plant foods mentioned in the writings of early observers include yams, macrozamia seeds, various fruits and the stems of the water lily (Backhouse 1843: 380; Caswell 1841; Scott 1929: 41; Threlkeld in Gunson 1974: 74). Nectar obtained from the blossoms of the grass tree (*Xanthorrhoea spp.*) and flower spikes of the dwarf banksia was also consumed (Dawson 1830: 244).

Regarding levels of residential mobility, available records suggest that this was generally quite high. Fawcett (1898a), for example, notes of the Wonnarua that: “they had no permanent settlements, but roamed about from place to place within their tribal district, in pursuit of game and fish, which was their chief sustenance, making use periodically of the same camping grounds, generation after generation, unless some special cause operated to induce them to abandon them”. Dawson’s (1830: 172) observation that “they [being the Aboriginal people of the Port Stephens area] seldom...stay more than a few days at these places [their camps], frequently not more than one night” is similarly suggestive, as is the 1877 observation, by an anonymous long-term resident of Maitland, that the Aboriginal people with whom he was familiar in the Maitland area “appeared to lead a very restless kind of life, constantly on the move, shifting their camps from one place to another, seldom remaining more than three or four days in one camp” (Anonymous, 1877d). Along the coast, Sokoloff (1980: 8) has suggested seasonal differences in settlement duration, noting that “the relative abundance of marine sources of food in summer tended to make the natives more sedentary at this time”.

As for the selection of campsites, we are limited to Fawcett’s (1898a: 152) observation that “in choosing the site, proximity to freshwater was one essential, some food supply a second, while a vantage ground in case of attack from an enemy was a third important item”.

5.4 Material Culture

Aboriginal material culture is explicitly linked to the natural environment and resource availability. For the Hunter Valley, available historical records identify an extensive array of hunting and gathering ‘gear’ and provide detailed insight into associated materials and manufacturing processes. The form and construction of everyday domestic structures are likewise well documented. Brayshaw (1987), in particular, provides a useful synthesis of both forms of material culture and highlights regional variability in raw material acquisition and utilisation between coastal and inland groups.

Campsites and domestic structures are well-represented in the accounts of early observers and were often the subject of illustration (Plate 1 and Plate 2). Huts, commonly referred to as “gunyers” or “gunyahs”, were of timber and bark construction. Fawcett (1898a: 152) describes the form and construction of huts as follows:

“A couple, or three, forked sticks, a few straight ones, and some sheets of bark, stripped from trees growing nearby, supplied the requisites for the construction of their home. The forked sticks were thrust into the ground and the straight ones placed horizontally in the forks. The sheets of bark were then set up against the horizontal poles in a slanting position, the bark of the structure being toward the windy point of the compass. The sides were frequently enclosed for further shelter, but the front was generally open. Before each one was a small fire, which was seldom allowed to go out, and which was used for warmth, or to cook by”.

Similar hut forms and construction methods can be found in the accounts of several other early observers, for example, Scott (1929: 13), Dawson (1830: 171-72), Caswell (1841) and Threlkeld (in Gunson 1974: 45).

Alongside its use in hut manufacture, tree bark also served as the primary construction medium for canoes, an integral component of the material culture repertoire of Aboriginal peoples occupying the Hunter Valley at contact. Available descriptions indicate that canoes were manufactured by bending, with the assistance of fire, a suitable sheet of bark into shape and securing the ends with bark cord or other 'wild vines' (Ebsworth 1826: 82; Dawson 1830: 79; Fawcett 1898a; Mrs Ellen Bundock in Brayshaw 1987: 60; Scott 1929: 38-39; Threlkeld in Gunson 1974:). Scott (1929: 39) reports that the gaps between the cord bindings at either end of the canoe were plugged with clay. Clay hearths were also added for warmth and cooking (Threlkeld in Gunson 1974; Scott 1929: 39). At Lake Macquarie, leaking canoes were repaired by sewing patches of tea tree bark over damaged areas and sealing them with melted grass tree resin (Threlkeld in Gunson 1974: 54).

Spears, which feature prominently in the literature, were an important component of men's 'gear' and were used in hunting, fishing, combat and ceremony (Scott 1929: 35; Threlkeld in Gunson 1974: 67-68). Spears for all purposes, Brayshaw (1987: 65) notes, were of composite manufacture and alongside sea shells, iron tomahawks and pieces of bottle glass, were important trade items, with significant numbers traded inland for possum skin rugs and fur cord (Dawson 1830: 135-136; Threlkeld in Gunson 1974: 65). Various hard woods and grass tree stems served as primary spear shafts and were shaped using shell scrapers and pieces of glass (Dawson 1830: 67, 135; Scott 1929: 35; Threlkeld in Gunson 1974: 67-68).

Plate 1 Joseph Lycett's '*Aborigines resting by camp fire, near the mouth of the Hunter River*', c.1820 (Source: National Library of Australia)

Plate 2 Augustus Earle's '*A Native Camp of Australian Savages near Port Stevens, New South Wales*', 1826 (Source: National Library of Australia)

Threlkeld (in Gunson 1974: 67) describes the manufacture and use of three different types of spears in the Lake Macquarie area, namely the fishing spear, the hunting spear and the battle spear. Primary shafts, in all three instances, comprised grass tree stems. However, differing types of points were added according to function. For the fishing spear, Threlkeld (in Gunson 1974) describes the affixing of bone barbs onto three or four 'shorter spears' of fire-hardened wood, themselves fastened to the main spear shaft with bark thread and grass-tree gum, while the hunting spear is described as being equipped with a single hard wood point. The battle spear, Threlkeld (in Gunson 1974: 67) reports, also had a single hard wood point but differed from its hunting counterpart in having "pieces of sharp quartz stuck along the hard wood joint on one side so as to resemble the teeth of a saw" (Threlkeld in Gunson 1974: 66). The substitution of glass for quartz on battle spears is also known to have occurred. In common with the Lake Macquarie area, Scott (1929: 35) notes the use, around Port Stephens, of different types of spears for hunting, fishing and combat. Differing functions aside, spears of all varieties were launched using spearthrowers or woomeeras, also of composite manufacture (Brayshaw 1987: 66).

Hatchets, like spears, were an important component of men's 'gear' and were used for variety of tasks including bark and wood removal, animal butchery, cutting toeholds in trees to facilitate climbing and extracting game and honey from logs and trees (Anon 1877a; Dawson 1830: 202; Scott 1929: 41; Threlkeld in Gunson 1974: 67). Known as *mogo*, hatchets were composite implements consisting of an edge-ground stone hatchet head and withe or flat, hardwood handle, the former secured to the latter using grass tree resin and cord (Dawson 1830: 202; Fawcett 1898a: 153; Scott 1929: 40). Hatchets, Scott (1929: 5) notes, were carried by men in belts worn around the waist. Post-contact, stone hatchets appear to have been rapidly replaced by iron substitutes (Brayshaw 1987: 66; Dawson 1830: 16).

Other notable items of men's gear described in the accounts of early observers include several types of hard wood clubs, two types of shield (one broad and one narrow) and returning and non-returning hard wood boomerangs (Anon 1877b; Scott 1929: 36-38; Threlkeld in Gunson 1974: 41, 68). Threlkeld (in Gunson 1974: 68) also describes the use of a "wooden sword" similar to a boomerang but with "a handle at one end with a bend contrary to the blade".

As for women's gear, Brayshaw (1987: 65) notes that, in addition to their daily use in gathering activities, digging sticks, also known as yamsticks, were status symbols that were sometimes used during altercations. These implements, up to 2 m long and around 4 centimetres (cm) in diameter, were manufactured out of hardwoods, were fire-hardened and typically not decorated (Brayshaw 1987: 65). Cord used in the manufacture of fishing lines and nets was made by women using the bark of various trees (e.g., the Cabbage-tree (*Livistona australis*) and the Kurrajong (*Brachychiton populneus*)) and is reported as having been extremely strong and durable (Ebsworth 1826: 79; Dawson 1830: 67; Scott 1929: 17). Dilly-bags were used by women for carrying small items such as fish-hooks, prepared bark cord, lumps of grass tree resin and food (e.g., fish and shellfish) and were worn slung around the head and draped down the back (Ebsworth 1826: 79-80).

Fish-hooks were reportedly manufactured out of oyster and pearl shell (Caswell 1841; Dawson 1830: 66, 308; Ebsworth 1826: 79; Threlkeld in Gunson 1974: 54). Threlkeld (in Gunson 1974: 54) reports that a suitable shell was simply "ground down on a stone until it became the shape they wished". However, Dyall's (2004) analysis of excavated examples from the Birubi Point midden complex suggests a more complex, multi-stage production process. Pieces of fine sandstone, shale and quartzite were used for filing down the hooks (Sokoloff 1980: 23).

Awls or 'needles' manufactured out of kangaroo bone were used in the repair of canoes and the sewing of skin cloaks (Fawcett 1898a; Threlkeld in Gunson 1974: 54). Items of clothing, where worn, included spun possum-fur belts, worn only by men, possum fur headbands and cloaks or rugs made from sewn kangaroo and possum skins (Dawson 1830: 15-16; Scott 1929: 5). Cloaks were worn by both men and women.

Alongside women's dilly bags, early accounts indicate the production and use of a variety of other containers, with tea tree bark a common construction material. Threlkeld (in Gunson 1974: 67, 156), for example, refers to tea-tree bark 'cups' and wooden 'bowls' "formed from some large protuberance of a growing tree" while Dawson (1830: 250) refers to "small baskets" made from tea tree bark.

Notably, references to the production and/or use of flaked stone artefacts are virtually absent from the historical record. Excluding hatchets, Threlkeld's (in Gunson 1974: 67) reference to the use of "pieces of sharp quartz" for barbing battle spears remains the only known primary reference in this respect. Brayshaw (1987: 68), for her part, has proposed that effective absence of flaked stone artefacts from the historical record may be a product of the fact that such artefacts were not being used at the time of European settlement, having been replaced with other materials (e.g., shell, glass, wood and bone)⁶. However, she also acknowledges that their use may simply have escaped the notice or interest of early observers.

5.5 Ceremony and Ritual

Evidence for ceremonial or ritual behaviour amongst the Aboriginal groups occupying the Hunter Valley at contact can be found in the accounts of a number of early observers (e.g., Anon 1877c; Dawson 1830; Enright 1936; Fawcett 1898a, 1898b; Scott 1929; Threlkeld in Gunson 1974), with documented 'ceremonial' activities including corroborees, male initiation ceremonies, marriage, ritual combat and various burial, body adornment and modification practices. Although limited in number, references to spiritual beliefs of the Aboriginal groups occupying the region are also present and attest to regional variability in belief systems.

Male initiation ceremonies, in which boys were "initiated into the privileges of manhood" (Fawcett 1898a: 153), are described by Enright (1936), Fawcett (1898a), Scott (1929) and Threlkeld (in Gunson 1974). Amongst the Wonnarua, Fawcett (1898a: 152) notes that the male initiation ceremony was known as *Boorool*. Enright (1936: 86), writing on the Worimi people, refers to the ceremony as the *Keeparra* while Scott (1929: 29) cites the terms *poombit* and *bora* in his recollections, noting that the latter was a colloquial term for the former. Initiation grounds, referred to by Scott (1929: 29) as 'poombit grounds', were elaborately prepared and consisted of one or two⁷ cleared circles in secluded areas of bushland. Images of animals and other designs were carved into surrounding trees and, in some cases, "figures of raised earth were created on the ground" (Brayshaw 1987: 83). Threlkeld (in Gunson 1974: 50-51, 63-65) describes attending, in November 1825, a ceremony "prepatory [sic] to removing the front tooth of several young men who would then be capable of marrying a wife". The site of this ceremony, Threlkeld (in Gunson 1974) reports, was known as the "Mystic Ring, or "Porrobung" and consisted of a circle "thirty-eight feet in diameter" with a small hillock at its centre. Trees near the ring were marked with "representations of locusts, serpents &c on the bark chopped with an axe".

As for the ceremonies themselves, Enright (1936: 87) reports that the *Keeparra*, in which "candidates learnt all those laws which governed his future life", lasted approximately one month but was "only a prelude to a long system of instruction which lasted some five years". Fawcett (1898a: 154), meanwhile, describes a ceremony involving tests of skill and endurance, the teaching of tribal laws, "emblematical dances" and the restricted involvement of women. Scott (1929: 28-34), too, describes the restricted involvement of women and dancing in the *poombit* or *bora* ceremonies of the Port Stephens area. Alongside their other important roles, medicine men or native doctors, known as *Karaji* (also spelt *Karadjys*), appear to have played an active role in initiation ceremonies and, together with group elders, were responsible for overseeing initiates' observance of instructed laws (Enright 1936; Fawcett 1898a).

Alongside its use in the initiation ceremonies described above, body painting with animal fat and/or ochre was undertaken as part of corroborees and for the purposes of ritual combat. For men, tooth avulsion, body scarification and septum piercing appear to have been undertaken in ceremonies subsequent to that associated with initiation (Fawcett 1898b; Scott 1929). Regarding items of personal adornment, Miller (1887: 3543) notes that the "principal ornament" of the Wonnarua was a "nautilus shell cut into an oval shape and suspended from the neck" while Fawcett (1898a: 153), also writing on the Wonnarua, reports that "the girls often adorned themselves with flowers, bone or reed ornaments, and shell necklaces". References to the dressing of men's hair in a conical form with tufts of grass attached are present in Dawson (1830) and Anon (1877c).

⁶ Historic references (e.g., Dawson 1830: 67, 135; Scott 1929: 35) to the use of shell scrapers and/or fragments of bottle glass for the shaping/sharpening of wooden spears provide some support for this suggestion.

⁷ Where two circles were used, these were separated by a distance of up to 400 m.

Available historical records suggest that burial in the earth was the most common form of burial practised by Aboriginal groups occupying the Hunter Valley at contact, with tea tree bark widely used as a burial shroud (Fawcett 1898b: 180; McKiernan 1911: 889; Miller 1887: 354; Scott 1929: 3; Threlkeld in Gunson 1974: 47, 89, 100). Grave goods consisted of items of personal gear such as spear and hatchets (McKiernan 1911: 889; Threlkeld in Gunson 1974: 47, 89, 100). Cremation is also known to have been practiced but is poorly represented in the historical record (Threlkeld in Gunson 1974: 99).

Regarding inter-group conflict, Haslam et al. (1984) have noted of the Hunter Valley as a whole that, although skirmishes were common, major clashes were infrequent. Ritual combat appears to have been linked principally to unsanctioned territorial incursions and the abduction of women (Fawcett 1898b).

Gunson (1974) notes a distinct difference between the spiritual beliefs of the Aboriginal groups occupying the inland and coastal portions of the Hunter Valley at contact. In contrast to the Awabakal of Lake Macquarie⁸, for example, whose supreme spiritual entity was known as *Koun* (pronounced cone), the inland Wonnarua and Kamilaroi are believed to have venerated the prominent sky cult hero *Biame*.

5.6 Post-contact History

As in other parts of NSW and Australia more generally, the early post-contact history of the Aboriginal people of the Hunter Valley is primarily one of dispossession and loss, with traditional hunting and camping grounds rapidly claimed and settled by Europeans and populations decimated by introduced diseases. However, active resistance and friendly relations are also attested in available records.

As highlighted by Brayshaw (1987), the introduction of European diseases had a devastating impact on the Aboriginal population of the Hunter Valley, with diseases such as smallpox, typhoid, influenza, scarlet fever, measles, diphtheria, whooping cough and croup causing or contributing to the deaths of large numbers of Aboriginal people. Major small pox epidemics between April and May 1789 and from 1829 to 1831 are known to have had a particularly deleterious impact on the valley's Aboriginal population (Butlin 1983).

The loss of traditional hunting grounds and a decline in the abundance of game that populated these areas have also been identified as factors relevant to the marked population decline that accompanied European settlement of the Hunter Valley, as has the sexual violence perpetrated by non-Aboriginal men against Aboriginal women (Turner & Blyton 1995). The destruction, over time, of the complex systems of social and territorial organisation that existed prior to contact has likewise been attributed to such factors, as has the collapse of traditional settlement and subsistence regimes. The effects of alcohol was also felt with alcoholism becoming a major contributor, alongside disease, to depopulation (Wilton, 1846).

Relations between Aboriginal people and the earliest European settlers of the Hunter Valley appear to have been relatively peaceful, with the *Sydney Gazette* reporting no incidents of conflict between 1822 and 1825 (Miller, 1985: 33). As Miller (1985) notes, the apparent absence of evidence for conflict during these early years of settlement is of particular note given both the rapidity of European settlement at this time and well documented racial conflict occurring in the Bathurst area to the west of the valley. Conflict, however, soon arose, with tensions over access to traditional camping and hunting/fishing grounds, the breaking of traditional laws and the abuse of Aboriginal women precipitating what Miller (1985) has referred to as the 'Wonnarua Uprising of 1826'. Retaliatory actions by groups of Aboriginal people at this time involved the plundering of crops, the killing or wounding of wrong-doers and a single abduction (Miller, 1985: 36). In September 1826, a troop of the 40th regiment under the command of Lieutenant Nathaniel Lowe was sent to the Hunter Valley to suppress the uprising, with a number of atrocities occurring as a result. Subsequent decades would see Aboriginal-settler conflict in the Valley decrease in frequency and magnitude, with Aboriginal people increasingly dependent upon European settlers and town's people for old clothing and would work at inns or farms for money or rations (Wilton, 1846).

⁸ Dawson's (1830: 153, 158, 163, 219, 220, 322) multiple references to an "evil spirit of woods" known as "Coen" suggest that the Worimi of the Port Stephens area, like the Awabakal, venerated *Koun* as opposed to *Biame*.

However, “spasmodic outbreaks of violence” were still a feature of relations between the two parties (Miller, 1985: 42).

By the late 1800s, growing concerns over the plight of Aboriginal people across New South Wales led to a series of Governmental initiatives aimed at both ‘protecting’ and ‘civilising’ the state’s Aboriginal population. In 1881, the Aborigines Protection Association was formed, with George Thornton appointed as ‘Protector of the Aborigines’ in the same year. Thornton was charged with investigating the status of Aboriginal people across NSW and to make recommendations for further action. Shortly thereafter, in 1883, the NSW Government established the Aborigines Protection Board (APB), which operated without any statutory power until the passing of the Aborigines Protection Act in 1909. This Act provided the board with extensive legal powers to control the lives of Aboriginal people, including powers to dictate where people lived and to remove children from their families. George Thornton, the APB’s founding chairman, was a strong advocate for the creation of Aboriginal reserves across the colony, arguing that such reserves would “enable them [Aboriginal people] to form homesteads, to cultivate grain, vegetables, fruit etc, etc, for their own support and comfort”. The reserves, Thornton proposed, would also “provide a powerful means of domesticating, civilizing and making them comfortable” (Thornton, 1881 in Goodall, 2008: 105).

Blyton et al. (2004), in their history of Aboriginal and European contact in the upper Hunter Valley, note that by the turn of nineteenth century “there were few outward signs that aspects of traditional Aboriginal society had survived in the Hunter Valley”. In July 1890, the APB designated a 58 acre (23 hectare) parcel of land at Carrowbrook, north of Singleton, as an Aboriginal reserve, with a community of Aboriginal people having lived in this area since at least the 1850s (Miller, 1985: 107). Three years later, in 1893, Reverend James S. White established the St Clair Mission here, with the APB increasing the original reserve by 24 acres (10 hectares) (Miller, 1985: 107). Aboriginal people whose traditional Country encompassed the Hunter Valley comprised a significant proportion of the mission’s population, with Wonnarua, Awabakal, Worimi and Darkinjung peoples represented. Occupants farmed the land, successfully growing and harvesting a variety of vegetables, but also engaged in traditional subsistence practices (Blyton et al., 2004: 57; Gray, 2018). In 1905, the mission came under the control of the Aborigines’ Inland Mission (AIM), an evangelical organisation founded by Baptist Missionary Retta Long (nee Dixon) and responsible, amongst other initiatives, for the establishment of the Singleton Girls’ Home (later Singleton Aboriginal Children’s Home) at ‘Glasgow Place’, on George Street in Singleton. The St Clair Mission operated under the control of the AIM until 1916 when control was taken over by the APB. The APB appointed a station manager to control the mission and its occupants and renamed it ‘Mount Olive Reserve’. Aboriginal people living at the Mount Olive Reserve, Blyton et al. (2004: 58-59) note, were subjected to the “absolute control of the manager”, with a significant number expelled for failing to adhere to strict regulations. In 1923, the reserve was closed to Aboriginal people.

The mid-to-late 1800s saw communities of Aboriginal people living on Reverend J S White’s property at Gowrie, as well as at Redbourneberry (Miller, 1985: 106-108). Those at Redbourneberry camped principally on the Redbourneberry Hill common, with the flood-free site comprising a traditional camping area and offering easy access town (Miller, 1985: 107-108). Court records indicate that Aboriginal people were living in this location from at least 1862, with many later records citing Redbourneberry as the place of residence for Aboriginal witnesses and defendants (Miller, 1985: 107). The APB’s Register of Reserves indicates that a portion of land to the south of Redbourneberry Bridge, around 3 km east of Singleton’s Central Business District (CBD), was designated as an Aboriginal reserve in July 1896. In the late 1930s, the construction of a large army camp outside Singleton saw a number of Aboriginal families evicted from their rented accommodation in town, with Miller (1985: 157) reporting their relocation to Redbourneberry Hill and the construction of make-shift houses from old kerosene tins and hessian bags.

Today, modern Wonnarua people retain strong cultural connections to the Hunter Valley and are actively involved in the protection and promotion of their culture for future generations.

6.0 Archaeological Context

This section describes the archaeological context of the study area on a regional and local scale. Archaeological data of relevance to this area, including the results of previous archaeological investigations within and surrounding the study area, are reviewed in order to contextualise the results of the current assessment.

6.1 Regional Context - The Hunter Valley

6.1.1 Introduction

Formal archaeological interest in the Aboriginal archaeological record of the Hunter Valley can be traced to the late 1930s, with the then Curator of Anthropology at the Australian Museum Fred McCarthy undertaking an archaeological reconnaissance of the Valley in 1939 (Moore 1970: 29). McCarthy's subsequent investigation, with F.A. Davidson, of an extensive open artefact site on a terrace of the Hunter River at Gowrie, near Singleton, is widely regarded as the first serious archaeological study of stone artefacts in the Hunter Valley proper (McCarthy & Davidson 1943). McCarthy's early endeavours aside, more detailed investigation of the Valley's Aboriginal archaeological record did not begin until the mid-to-late 1960s, a period that witnessed a series of archaeological surveys and site excavations completed as part of the Australian Museum's long term and wide ranging archaeological research project into the Aboriginal prehistory of the Hunter Valley (Moore 1969, 1970, 1981).

Intensive development activities since this time have secured the Hunter Valley's place as one of the most intensively investigated archaeological regions in Australia, with hundreds, if not thousands, of Aboriginal archaeological investigations involving survey and/or excavation having now been undertaken, the majority as part of larger environmental impact assessments associated with coal mining projects. Not surprisingly, these investigations have varied significantly in scale and scope, ranging from targeted small-scale surveys to complex, multi-phase survey and excavation projects over large areas. Nonetheless, together, they have generated a large and diverse body of evidence for past Aboriginal occupation, with thousands of Aboriginal sites now registered on OEH's AHIMS database. Together with Dean-Jones and Mitchell's (1993) pioneering environmental study, existing syntheses of the Aboriginal archaeological record of the Hunter Valley (e.g., ERM 2004; Hughes 1984; Koettig 1990; MacDonald & Davidson 1998) provide a suitable interpretive framework for the current assessment. Key research themes are detailed in brief in the following sections.

6.1.2 Open Artefact Sites: Distribution, Contents and Definition

Surface and subsurface distributions of stone artefacts, variously referred to as open artefact sites, open sites and open camp sites, are by far and away the most common and widely distributed form of Aboriginal archaeological site in the Hunter Valley (ERM 2004; Hughes 1984; MacDonald & Davidson 1998). Other site types, such as scarred trees, shell middens, quarries, grinding grooves, burials and rock shelters with deposit and/or art or potential archaeological deposit (PAD), have also been identified but are comparatively rare. Accordingly, open artefact sites remain the most intensively investigated component of the Aboriginal archaeological record of the Hunter Valley, with site distribution, site structure and the technology of backed artefact manufacture, in particular, comprising key research topics (Baker 1992a, 1992b, 1992c; Hiscock 1986a, 1986b, 1993a; Koettig 1992, 1994; Moore 1997, 2000; White 1999, 2012).

As highlighted by Hughes (1984) and reiterated by numerous other researchers (e.g., ERM 2004; Koettig & Hughes 1983, 1985; Koettig 1992, 1994; Kuskie 2000; Rich 1992), existing archaeological survey data for the Hunter Valley indicate a strong trend for the presence of open artefact sites along watercourses, specifically, on creek banks and 'flats' (i.e., flood/drainage plains), terraces and bordering slopes. Although this distribution pattern can be attributed in part to geomorphic dynamics and archaeological sampling bias, with extensive fluvial erosion activity along watercourses resulting in higher levels of surface visibility and, by extension, concentrated survey effort, an occupational emphasis on watercourses is supported by the results of several large scale subsurface salvage projects (e.g., Koettig 1992, 1994; Kuskie & Clarke 2004; Kuskie 2000; MacDonald & Davidson 1998; OzArk 2013; Rich 1992; and Umwelt 2006).

Collectively, these projects have also shown that assemblage size and complexity tend to vary significantly in relation to both landform and stream order, with larger, more complex⁹ assemblages concentrated on elevated, low gradient landform elements adjacent to higher order streams.

In the Lower Hunter Valley, a similar pattern has been identified for the permanent to semi-permanent wetlands of the Hunter 'delta' (e.g., Kuskie 1994; Kuskie & Kamminga 2000). Outside of these contexts, surface and subsurface artefact distributions have typically been found to be sparse and discontinuous and are often referred to as 'background scatter'.

Flaked stone artefacts dominate archaeological assemblages from recorded open artefact sites within the Hunter Valley (Hiscock 1986a), with heat fractured rock also well represented. Items such as complete and fragmentary grindstones, hammerstones, edge-ground hatchet-heads, ochre and shell have also been identified though comparatively infrequently. With the notable exception of 'knapping floors', a relatively common component of the open artefact site record of the Hunter Valley, associated archaeological features (e.g., hearths and heat treatment pits) have likewise proven elusive (for examples see Koettig 1992; Kuskie & Kamminga 2000).

Defined in slightly different ways by different researchers, knapping floors can be broadly defined as spatially-discrete activity areas in which primacy was given to the reduction of one or more stone packages (White 1999:152). Recorded knapping floors in the Hunter Valley vary considerably in size and complexity, with some of the largest and most complex examples identified through excavation as opposed to survey. Backed artefacts are a common feature of knapping floors and most of these features were likely specifically associated with their production. At Narama, near Ravensworth, a detailed analysis of the contents of knapping floor and non-knapping floor assemblages revealed significant differences between the two, including variation in the frequency of backed artefacts, other retouched and/or utilised tools and cores, and the application of different reduction strategies (Rich 1992). Together with differences in the spatial distribution of the two forms of assemblage, this evidence was used to suggest that backed artefact production within the Narama landscape was a highly structured activity, and that knapping floor assemblages were the product of a more restricted range of behaviours than more generalised scatters. Although limited to a single landscape, evidence from other parts of the Valley (e.g., Hiscock 1986a; Koettig 1992, 1994) provides further support for the suggestion that backed artefact manufacture in the Hunter Valley was a highly structured activity.

Although relevant to a variety of site types, geomorphic processes such as soil erosion, colluvial/fluvial aggradation and aeolian transportation are of particular relevance to the identification and definition of open artefact sites. As in other archaeological contexts (e.g., Attenbrow 2010; Fanning & Holdaway 2004; Fanning et al. 2009; Holdaway *et al.* 2000), it is now widely accepted by archaeologists working in the Hunter Valley that the visibility and distribution of open artefact sites within the region are, for the most part, products of contemporary and historical geomorphic processes which have variously exposed and obscured them. As demonstrated by numerous large scale archaeological salvage projects within the Valley (e.g., Koettig 1992, 1994; Kuskie & Clarke 2004; Kuskie & Kamminga 2000; MacDonald & Davidson 1998; OzArk 2013; Rich 1992; Umwelt 2006), surface artefacts invariably represent only a fraction of the total number of artefacts present within recorded surface open artefact sites, with the majority occurring in subsurface contexts. Artefact exposure, unsurprisingly, is highest on erosional surfaces and lowest on depositional ones. At the same time, in many areas, surface artefacts have been shown through large-scale subsurface testing to form part of more-or-less continuous subsurface distributions of artefacts, albeit with highly variable artefact densities linked to environmental variables such as distance to water, stream order and landform.

Such evidence has posed a significant analytical and interpretive dilemma for archaeologists working in the Hunter Valley. Defining sites on the basis of surface artefacts alone is clearly problematic, with modern site boundaries frequently reflecting the size and distribution of surface exposures as opposed to the actions of Aboriginal people in the past. Nonetheless, for pragmatic reasons, this has been the most commonly used approach, with 'distance' and 'density-based' definitions dominating. In the Hunter Valley, two of the most commonly employed distance-definitions are '*two artefacts within 50m of each other*' and '*two artefacts within 100 m of each other*'.

⁹ Those containing a wider variety of raw materials and technological types and/or higher mean artefact densities and features such as knapping floors and hearths.

Neither definition is derived from a particular theoretical approach or body of empirical research - they are simply pragmatic devices for site definition. Definitions based on artefact density also vary in their particulars. However, one of most commonly used definitions is that which isolates, within an arbitrarily defined 'background scatter' of one artefact per 100 m², higher density clusters that are subsequently defined as 'sites'.

While not widely employed, Kuskie's (1994, 2000a) system of open artefact site definition, developed for use in the Hunter Valley and other surrounding regions, is also worthy of note here. In short, this system is predicated on the definition of 'survey areas' within broader 'Archaeological Terrain Units' (ATUs), with the latter comprising discrete, recurring areas of land defined on the basis of landform element and slope class, and the former, an area of a single ATU bounded on all sides by different ATUs (Kuskie 2000: 65-67).

Within this overarching environmental scheme, open artefact sites are defined by the presence of one or more stone artefacts within a survey area, with site boundaries corresponding with the boundaries of the broader survey area irrespective of the visible extent of artefacts within it. Spatially discrete occurrences of stone artefacts within a given site boundary are referred to as 'loci' (Kuskie 2000: 65-66).

6.1.3 Flaked Stone Artefact Technology

Flaked stone artefacts are a ubiquitous element of the Aboriginal archaeological record of the Hunter Valley and, as such, have assumed a pre-eminent role in archaeological reconstructions of past Aboriginal land use in the region. To date, hundreds, if not thousands, of surface-collected and excavated chipped stone assemblages from the Hunter Valley have been analysed, with individual assemblage sizes, research questions, aims, analytical methodologies and terminological schemes varying significantly between researchers and projects. Studies to date have ranged from basic descriptive accounts of assemblage composition in typological terms to detailed reconstructions of specialised knapping techniques through rigorous technological analyses (including conjoining) and, in some instances, experimental research. Particularly informative analyses in the context of the Hunter Valley include those undertaken by Hiscock (1986a, 1986b, 1993a), Koettig (1992, 1994), Moore (1997, 2000), White (1999, 2012) and Baker (1992a, 1992b, 1992c).

As highlighted by Koettig (1994) and others (e.g., Hiscock 1986a; Hughes 1984), available technological and typological data for surface collected and excavated flaked stone artefact assemblages from the Hunter Valley suggest that the majority of these assemblages belong to what is known as the 'Australian small-tool tradition', a term coined by Gould (1969) to describe what was then thought to be the first appearance, in the mid- Holocene¹⁰, of a new suite of chipped stone tool forms in the Aboriginal archaeological record of Australia, including Bondi points, geometric microliths, adzes and points (both unifacially and bifacially flaked). Complex, hierarchically-organised reduction sequences associated with the production of these tools contrast markedly with the simple sequences of earlier periods (Moore, 2014). Tools of the Australian small-tool tradition, it has been suggested, formed part of a portable, standardised and multifunctional tool kit aimed specifically at risk reduction (Hiscock 1994, 2006). Stone artefact assemblages from late Pleistocene and early Holocene contexts, in contrast, are described by archaeologists as belonging to the 'Australian core tool and scraper tradition', a term first used by Bowler *et al.* (1970) to describe the Pleistocene assemblages recovered from Lake Mungo in western New South Wales. Bowler *et al.* (1970) saw the main components of these assemblages - core tools, steep-edged scrapers and flat scrapers - as characteristic of early Australian Aboriginal assemblages and as being of a distinctly different character to those associated with small-tool tradition.

In southeastern Australia, including the Hunter Valley, the Australian small-tool and core tool and scraper traditions are most commonly described in terms of McCarthy's (1967) *Eastern Regional Sequence* (ERS) of stone artefact assemblages.

¹⁰ Note that more recent research into the chronology of backed artefacts and points in Australia (e.g., Hiscock & Attenbrow, 1998, 2004; Hiscock, 1993b) has demonstrated a long history of production and use for these implement types, with both now known to have been produced in the early Holocene and likely in the late Pleistocene as well.

Based on appreciable changes in the composition of chipped stone artefact assemblages over time, the ERS hypothesises a three phase sequence of 'Capertian' (earliest), 'Bondaian' and 'Eloueran' (most recent) assemblages and was developed on the basis of McCarthy's (1948, 1964) pioneering analyses of stratified chipped stone assemblages from Lapstone Creek rockshelter, on the lower slopes of the Blue Mountains eastern escarpment, and Capertee 3 rockshelter in the Capertee Valley north of Lithgow. At present, the most widely cited characterisation of the ERS is that of a four-phase sequence beginning with the *Pre-Bondaian* (McCarthy's *Capertian*) and moving successively through the Early, Middle and Late phases of the *Bondaian*, the last of which equates to McCarthy's (1967) *Eloueran* phase. The tripartite division of the Bondaian is based principally on the presence/absence and relative abundance of backed artefacts (Attenbrow 2010: 101). However, other factors, such as changes in the abundance of bipolar artefacts and different stone materials, as well as the presence/absence of edge-ground hatchet-heads are also relevant.

Table 6 McCarthy's Eastern Regional Sequence (ERS) of stone artefact assemblages

Current phasing	McCarthy's (1967) Phasing	Approximate date range	Backed artefact frequency	Bipolar artefacts	Edge-ground hatchet heads
Pre-Bondaian	Capertian	40,000-8,000 BP	Absent	Rare	Absent
Early Bondaian	Bondaian	8,000-4,000 BP	Very low	Rare	Absent
Middle Bondaian		4,000-1,000 BP	Very high	Increasingly common	Present
Late Bondaian	Eloueran	1,000 BP to European contact	Very low	Very common	Present

Existing assemblage data indicate that Aboriginal knappers occupying the Hunter Valley utilised a diverse range of lithic raw materials for flaked stone artefact manufacture (Hughes 1984). However, two rock types - silcrete and silicified tuff (also known as mudstone) - overwhelmingly dominate the region's existing stone artefact record and appear to have been routinely selected for this task, likely due to both basic raw material abundance and their desirable flaking qualities (Hiscock 1986a). Alongside other, less-commonly exploited raw materials, such as quartz, quartzite, chalcedony, chert, petrified wood and various fine-grained volcanics, both are available in alluvial and colluvial gravel deposits¹¹ associated with the Hunter River and its tributaries (Raggatt 1938; see also Hiscock 1986a:14-16). Widely distributed and easily accessible, it would appear that these deposits functioned as the primary source of lithic raw materials for Aboriginal flaked stone tool manufacture in the Hunter Valley proper.

In the Hunter Valley, asymmetrical and symmetrical backed artefacts dominate the retouched components of surface collected/recorded and excavated flaked stone assemblages. Accordingly, the technology of backed artefact manufacture has been a particular focus of research (e.g., Baker 1992a; Hiscock 1993a; Koettig 1992, 1994; Moore 2000). Studies by Hiscock (1993a), Moore (2000) and others (e.g., Baker 1992a; Koettig 1992, 1994; White 1999, 2012) have demonstrated that backed artefact manufacture in the Hunter Valley was a highly structured activity involving a complex system of raw material procurement, transportation, preparation and reduction. Differences in the technological character of recovered cores and conjoin sets across the Valley indicate a significant degree of variability in the strategies used by Aboriginal knappers to produce blanks for backed artefact manufacture (Figure 17). Heat treatment, notably, appears to have been an integral component of the backed artefact manufacturing process, with evidence for the thermal alteration of stone packages throughout the reduction process both abundant and widespread. As Hiscock (1993:66) has observed, "the thermal alteration of Hunter Valley silcrete drastically improves flaking qualities and increases the lustre and smoothness of the fracture surface". Compared with silcrete, evidence for the thermal alteration of indurated mudstone blanks is rare (e.g., Koettig 1992) and likely reflects the generally higher 'raw' flaking quality of this material.

¹¹ i.e., active point and mid-channel gravel bars, as well as elevated terrace and palaeochannel remnants.

Alongside the reconstruction of backed artefact manufacturing processes, the identification of diachronic change in Bondaian lithic technology in the Hunter Valley has also received considerable analytical and interpretive attention (e.g., Baker 1992c; Haglund 1989; Hiscock 1986a, 1986b). Hiscock's (1986a) pioneering attribute analysis of a sample of unretouched mudstone flakes recovered from the Sandy Hollow 1 rockshelter excavated by Moore (1970) is of particular significance in this regard and can be regarded as the foundation upon which subsequent studies have been carried out. This analysis sought to test a tripartite division of the Sandy Hollow 1 (SH1) assemblage made on the basis of chronological changes in the frequency of backed artefacts. Three phases were recognised: the *Pre-Bondaian*, with no backed artefacts, the *Phase I Bondaian*, with numerous backed artefacts and the *Phase II Bondaian*, with few backed artefacts. Attribute analysis of a sample of 742 complete mudstone flakes from Square AA revealed technological changes consistent with this division, including, but not limited to, changes in the relative frequency of platform preparation and overhang removal as well as flake shape and platform size (see Table 7).

Table 7 Hiscock's relative dating scheme for the Sandy Hollow 1 flaked stone assemblage (after Hiscock 1986a: 100)

Phase	Date range	Flake type	Knapping practices employed for flake production	Backed artefact frequency
Pre-Bondaian	>1300 BP	Medium-sized, relatively squat flakes with very large platforms	<ul style="list-style-type: none"> • Large amounts of force applied with little control; • Mostly normal or inward directions of force application; • Imprecise blow application; • Use of relatively low platform angles on cores; • Very little platform preparation of any kind; • Many blows delivered to cortical surfaces; • No platform faceting; • Infrequent overhang removal; and • Low to moderate amounts of core rotation. 	Absent
Phase I Bondaian	1300-800 BP	Larger and more elongate flakes with medium sized platforms	<ul style="list-style-type: none"> • Relatively high amounts of force; • Mostly normal or inward directions of force application; • Imprecise blow applications; • High platform angles; • Large amounts of platform preparation (principally faceting and larger platform flaking); • Infrequent overhang removal; and • High amounts of core rotation. 	Numerous
Phase II Bondaian	800 BP - Contact	Relatively small and squat flakes with small platforms	<ul style="list-style-type: none"> • Low to moderate amounts of force; • Outward directions of force application; • Precise application of force; • High platform angles; • Moderate amounts of platform preparation (flaking onto platform but no faceting) • Frequent overhang removal; and • Moderate to low amounts of core rotation. 	Few

Having established the validity of the three phase Bondaian sequence at SH1, Hiscock applied the same attribute analysis to a series (n = 15) of flaked stone assemblages recovered from open artefact sites on the Mount Arthur North and Mount Arthur South coal leases and found that individual assemblages could be assigned to one of the three Bondaian phases recognised at SH1. On this basis, Hiscock (1986b) proposed that the attribute analysis employed at SH1 could serve as a relative dating system for open sites in the Hunter Valley. Given the number of open artefact sites within the region, this argument was particularly ground-breaking and has prompted several archaeologists to apply Hiscock's analysis to assemblages from other areas, albeit with mixed success (e.g., Dean-Jones 1992; Baker 1992c; Haglund 1989; Rich 1991). Difficulties in replicating Hiscock's results, Holdaway (1993:29) has suggested, likely stems from spatial variability in the methods used by Aboriginal knappers to reduce stone, variability itself linked to variables such as raw material type and accessibility, site function and stylistic differences between Aboriginal groups.

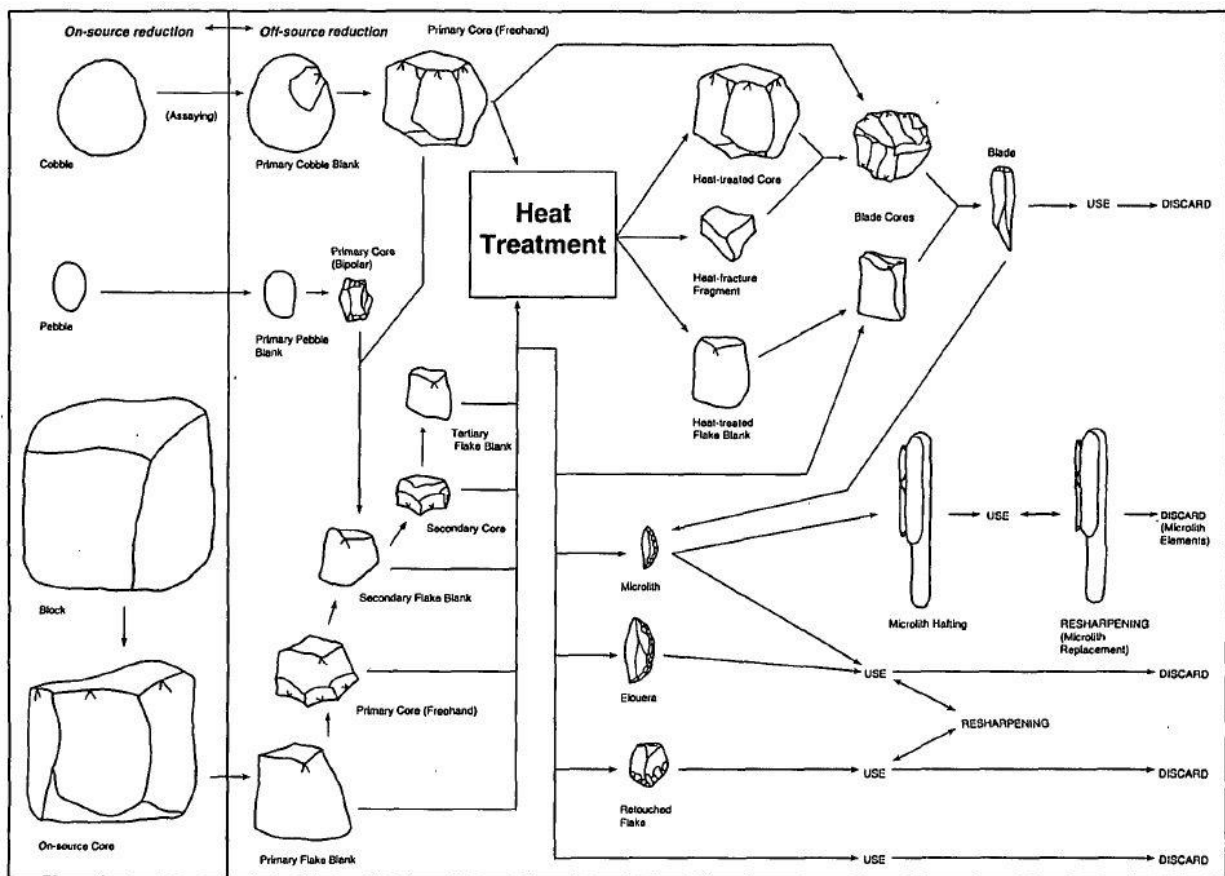

Figure 17 Moore's (2000) reduction model for the technology of Hunter Valley microlith assemblage (from Moore 2000: 29, Fig. 5)

6.1.4 Aboriginal Stone Quarrying: Australia & the Hunter Valley

Investigations of Aboriginal stone quarry sites in Australia began more than a century ago (Helms 1895; Noetling 1907, 1908). From the late 19th Century to the mid-20th Century these investigations largely comprised simple descriptive accounts of quarry sites and their contents, focusing on artefact typologies, types of activities undertaken and site ownership (Doleman 2008). During the 1970's, reflecting broader changes to archaeological theory and development of processual methodologies (Binford 1980; Binford & Binford 1968), quarry sites were incorporated into studies of settlement system organisation and their role in such systems explored.

However, despite the long history, comparatively few quarry sites in Australia have been subject to detailed investigations, particularly on mainland Australia in comparison to Tasmania (Reid 1998).

In their evaluation of previous work on stone quarries in Australia, Hiscock et al. (1993:78-80) recognised four major areas of research involving quarries including:

1. Manufacturing technology;
2. Organisation of production;
3. Organisation of stone distribution; and
4. Logistical and settlement patterns.

A fifth area of research, the focus of Doleman's (2008) BAR Series, is the study of technical organisation, that is, studies that link artefact patterning and variability to technological strategies used by hunter-gatherers to adapt to their particular environment. Combined, these studies have produced a wealth of information about how stone was procured and reduced at quarry sites alongside the organisation of behaviour and distribution of material across the landscape. However, as noted by Hiscock & Mitchell (1993) despite the potential for quarries to reveal important information about past societies, overall our knowledge of quarries is "diminutive and patchy".

As to the definition of what constitutes a quarry, definitions have varied amongst researchers ranging from simply a source of stone artefact raw material in the form of pebbles, cobbles and/or boulders (utilised or not) through to sites where only particular types of reduction activities were taking place (e.g., tool manufacture). In search of a definition that was inclusive of the full range of activities linked to stone procurement, Hiscock & Mitchell (1993) proposed the definition – "the location of an exploited stone source" as this incorporates both mines and non-mines, alongside quarries where visible manifestations of use are not available. On the basis of this broad definition, three attributes might reasonably be expected at quarry sites. Firstly, there must be a source of raw material suitable for the production of stone tools. Secondly, there may be either evidence of modification of this raw material (artefacts) or thirdly evidence of procurement in the form of excavation and/or gathering. Evidence of modification/procurement will vary according to the type of quarry e.g., underground or surface, hardstone or ochre. For surface hardstone quarries, Hiscock & Mitchell (1993:61) suggest the main indications of quarrying will be a source of stone with an associated reduction activity, petrological distinctiveness of material and debris created from breaking stone too large to transport, or evidence of rock removal i.e., impact scars, use of wedges or fires to shatter rock.

In terms of reduction activities associated with raw material sources, Moore (2000:29) divides these into on-source reduction activities and off-source reduction, and notes that both were practiced by Hunter Valley knappers, with procurement generally focused on Hunter River gravels. Researchers in the Hunter Valley have contended that evidence of quarrying at gravel sources will tend to produce a low density background scatter of flakes and flaked cobbles that are the results of assaying (and cobble rejection) through to high densities associated with systematic reduction activities (i.e., flaking and heat shattering of stone) (Jones & White, 1988; White 1998; Moore 2000). Moreover, on-source reduction is argued to produce flake blanks considerably larger than those produced off-source, with the blanks considered to be early stages in the reduction sequence (Hiscock & Mitchell 1993; Moore 2000). Heating may also have also been utilised to split boulders into more manageable packages (White 1998). Moore (1997) suggests that raw material procurement and on-site reduction may have been undertaken during logistical forays or 'embedded' during the carrying out of subsistence tasks.

As discussed in Section 6.1.3, existing artefact assemblage data for the Hunter Valley indicate that Aboriginal people utilised a diverse range of lithic raw materials for flaked stone artefact manufacture albeit with a focus on silcrete and silicified tuff. Other, less-commonly exploited raw materials, such as quartz, quartzite, chalcedony, chert, petrified wood and various fine-grained volcanics have also been identified. Accordingly, quarry sites in the Hunter Valley would be expected to contain exploitable clasts of these materials with higher frequencies of silcrete and silicified tuff. Previous studies have suggested that the Hunter River Gravels are the most well-known source of silicified tuff, silcrete, and quartz raw materials in the Hunter Valley (Dean-Jones & Mitchell 1993; Moore 2000). Exposed at numerous locations in the valley, both as active gravel bars and elevated terrace/palaeochannel remnants, they have been recorded at Muswellbrook, Denman, Jerrys Plains and Singleton (Dean-Jones & Mitchell 1993). Raw materials, including silicified tuff and silcrete, are thought to be locally derived, reflecting the Hunter River's underlying geology, and smaller deposits of non-local material transported from other parts of the system (MacDonald and Davidson 1998).

In context of the Hunter Valley, Aboriginal stone quarry sites are a comparatively rare component of the archaeological record, with only eight instances, for example, recorded on the AHIMS database (search completed in 2012) of which two are recorded as potential raw material sources without associated evidence of exploitation. The remaining known six sites vary in relation to raw materials present, intensity of use and their topographical locations. A review of available site cards for the sites indicates that exposed silcrete cobbles of varying sizes were an almost universally present raw material, being recorded at five of the six locations and exclusively at three locations. Cobbles of silicified tuff (i.e., mudstone, chert) were recorded, alongside silcrete at three sites, and quartzite/quartz at three locations. Estimates of the total number of artefacts were recorded on only four site cards with artefacts numbers ranging from five to several hundred. In three instances, initial stages of reduction were noted, including shattered cobbles, large flakes and minimally modified cores. In almost all cases, quarry sites were recorded within 1 km of the Hunter River or its major tributaries, amongst alluvial and colluvial gravel deposits. Despite the presence of quarry sites in both the Upper and Lower Hunter Regions, only one has been excavated and subject to detailed investigation - the B10 quarry site (White 1998).

Nonetheless, Moore (2000:29) noted, during an inspection of riverbed gravels near Jerrys Plains and a gravel quarry south of Maison Dieu Road, a number of silcrete and tuff cores thought to represent on-source reduction. No detailed recording was made of these finds. In addition, Hughes and Lance (in Hiscock 1986:14-16) identified 22 Aboriginal mudstone cores within a 1,200 m² section of large gravel bar (80 m wide and 1.5 km long) at the mouth of the Goulburn River near Denman.

6.1.5 Chronology and Texture-Contrast Soils

Evidence for late Pleistocene and/or early Holocene Aboriginal occupation of the Hunter Valley is rare, with dated and undated evidence from these periods obtained from only a handful of sites, two of which (i.e., Moffats Swamp Dune & Galloping Swamp) are located on the Valley's coastal plain (AMBS 2002; Baker 1994; Hughes & Hiscock 2000; Koettig 1986; Kuskie in prep.; Rich 1993; Scarp Archaeology 2009). As recently discussed by Hughes et al. (2014), the dearth of early sites in the central lowlands of the Hunter Valley can be attributed to long term geomorphic and soil formation processes which have acted to either remove completely or widely disperse older archaeological materials.

Studies by Koettig (1990), Baker (1994) and Kuskie (in prep.) suggest that the flaked stone technology employed by Aboriginal knappers occupying the Hunter Valley during the terminal Pleistocene/early Holocene was focused on the opportunistic or non-specific reduction of early reduction cores (*sensu* Moore 2000) - some of which were very large. Core reduction appears to have been geared towards the production of robust flakes for immediate use or retouching into simple scrapers, with no evidence for the complex, hierarchically-organised reduction sequences typical of the mid-to-late Holocene. Tool edges, Moore (2000: 36) notes, were refurbished by unifacial retouching. A preference for volcanic materials over silcrete and mudstone has also been noted (Baker 1994; Koettig 1990, 1992:5), as has the paucity of evidence for deliberate heat treatment (Moore 2000)

In contrast to the late Pleistocene/early Holocene, evidence for mid-to-late Holocene Aboriginal occupation of the Hunter Valley abounds, with numerous excavated sites producing assemblages that can be confidently ascribed to these periods on the basis of radiometric dates and/or their typological/technological profiles. Taken at face value, available radiocarbon determinations suggest a progressive increase in the Aboriginal population of the Hunter Valley over the course of the Holocene (Attenbrow 2006). However, as argued by Hiscock (2008) on a national scale, it seems likely that the directional population growth suggested by such data is, to a certain extent at least, a product of differential site preservation, with younger sites better preserved than older ones. Other factors, such as the burial of older sites through sediment deposition and aeolian processes and bias in the location of archaeological surveys and excavations, may also be relevant.

Critical to any discussion concerning the antiquity of Aboriginal occupation within the Hunter Valley are the well-documented difficulties surrounding the dating of open artefact sites with active 'biomantles' (*sensu* Paton et al. 1995; see Dean-Jones & Mitchell 1993; Balek 2002; Hofman 1986; Johnson et al. 2005; Johnson 1989; Paton et al. 1995; Peacock & Fant 2002; Stein 1983). In the Hunter Valley, the term biomantle is typically used as a collective descriptor for the 'A' soil horizons of the Valley's dominant texture contrast or duplex soil profiles¹², which tend to be relatively thin (<30 cm), and exhibit extensive evidence of bioturbation in the form of roots, open/infilled burrows, live insects and/or earthworms and stone lines¹³. As highlighted by Dean-Jones and Mitchell (1993) and others (e.g., Balek 2002; Johnson 1989), excavated finds assemblages from archaeological sites with active biomantles are subject to a range of interpretive constraints, with intact depositional stratigraphy unlikely to be preserved and inset archaeological features (e.g., hearths and heat treatment pits) representing the only reliable means of dating (with any specificity) intercepted archaeological events (Mitchell 2009: 4). Any stone artefacts discarded at the surface in landscapes with active biomantles are likely, over time, to have been incorporated into the soil profile through bioturbation, with depth of artefact burial ultimately corresponding to the base of major biological activity (i.e., the base of the biomantle). Where biomantles remain relatively undisturbed, patterns of artefact discard may be preserved. However, in heavily disturbed contexts, the preservation of such patterning is unlikely (Mitchell 2009: 4).

For archaeologists working in the Hunter Valley, the analytical and interpretive constraints posed by intensive bioturbation have, in combination with a real paucity of dateable features, led to a reliance on the dating of excavated archaeological finds assemblages through relative means, specifically, through consideration of the typological and technological composition of associated flaked stone artefact assemblages and reference to a modified version of McCarthy's (1967) ERS (Table 6). While offering a useful chronological framework within which to assess diachronic changes in the stone artefact technologies and raw material use, the largely undated and palimpsest character of the Valley's lithic record represents a significant analytical and interpretive obstacle for period-specific reconstructions of Aboriginal mobility regimes (cf. Cowan 1999).

More broadly, Dean-Jones and Mitchell (1993: 63-64) have highlighted a series of geomorphic contexts within the Hunter Valley that they believe represent favourable locations for the preservation of Pleistocene and/or early Holocene archaeological evidence. These include:

- rock shelters and large middens;
- Aeolian sand deposits (e.g., source bordering dunes);
- the distal portions of low angle alluvial fans;
- stream junctions where each tributary has a different rate of sediment supply; and
- colluvial deposits at the base of steeply inclined surfaces.

To date, the two contexts that been shown to have the potential to contain recognisable older archaeological materials include late Pleistocene windblown sand dunes/sheets (e.g., AMBS 2002) and late Pleistocene/early Holocene colluvial deposits (e.g., Hughes & Hiscock 2000).

6.1.6 Occupation models

A number of Aboriginal occupation models have been proposed for the Hunter Valley over the past three decades, with existing models based on varying combinations of archaeological, environmental and ethnohistoric data. Key models for the Central and Lower Hunter Valley include those developed by Haglund (1992), Koettig (1992, 1994), Kuskie (2000) and Kuskie and Kamminga (2000). These models are summarised in Table 8.

¹² Such profiles are characterised by loamy topsoils and silty clay to clay subsoils, with boundaries between these two units typically clear to abrupt. Clayey subsoils have formed by *in situ* weathering of the parent material, while topsoils are derived from a combination of *in situ* weathering and the deposition of colluvially and/or fluvially transported materials.

¹³ Stone lines, where present, typically occur at the interface between the A and B horizons.

Table 8 Aboriginal occupation models for the Hunter Valley

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
Koettig	1992 & 1994	Salvage of sites within the Camberwell and Bulga Coal Mine Leases	Central lowlands	<ul style="list-style-type: none"> Repeated occupation of an area is likely to be represented by continuous, or near continuous, distributions of archaeological sites and/or features; Sporadic or less intensive occupation of an area is likely to be represented by non-continuous or more widely dispersed archaeological sites and/or features; Continuous to near- continuous distributions of archaeological evidence along watercourses suggest that Aboriginal people did not camp at specific locations; Frequency of occupation at a given location is likely to have been related to the availability of subsistence resources (e.g., food, water, lithic raw materials); Some locations may have been foci for Aboriginal occupation owing to the presence of particular resources (e.g., sandstone exposures suitable for grinding hatchet-heads); and The duration of occupation at a given location may be evidenced by levels of disturbance to associated archaeological deposits, with sites occupied for shorter duration potentially having more intact deposits, as the length of stay may have been insufficient to disperse artefacts or mask the original form of knapping floors. 	Koettig 1992, 1994
Haglund	1992	Salvage of sites along Doctors Creek, Warkworth	Doctors Creek area, Central Hunter Valley	<ul style="list-style-type: none"> Kangaroos, wallabies, and other large and small game would have been abundant in the area during dry periods, and would have been hunted by small hunting parties of men who would prepare and repair their hunting equipment in close proximity to watercourses; Larger family groups likely visited the area during wetter periods when watercourses would be flowing more reliably and moisture dependent plants occurred in greater abundance; Women and children would procure and process plant foods, such as ferns, yams and other tubers, in the vicinity of creeks and watercourses; Sporadic visits would have resulted in debris left behind being incorporated into the turf or buried by leaf litter and Casuarina needles more quickly than more intensive, long term visits; and 	Haglund 1992

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<ul style="list-style-type: none"> While some equipment such as grindstones may have been retained and carried throughout the landscape, flakes and other implements were likely manufactured, utilised and discarded on an “as needed” basis. 	
Kuskie	2000	Archaeological survey of Mount Arthur North Coal Mine Lease	Mount Arthur Area, Central Hunter Valley	<ul style="list-style-type: none"> The area has been occupied for at least the past 5,000 years; Occupation may extend as far back as 30,000 - 40,000 years; The area has predominantly been occupied by tribes of the Wonnarua language group, although members of neighbouring groups may also have sporadically visited and occupied the area. The Mount Arthur North area was likely utilised and occupied by Aboriginal people at varying intensities on a seasonal basis; Occupation was most intensive within 50m of the main watercourses (3rd and 4th order streams); Aboriginal occupants had a strong preference for camping on level ground adjacent to reliable water sources and potentially more abundant subsistence resources; Individual campsites were mainly occupied by single nuclear family groups and multiple family groups (bands); Larger campsites from broader gatherings of people likely took place along the nearby Hunter River flats; A greater range and frequency of activities were undertaken at camp sites, rather than in the surrounding landscape; Camp sites along the major watercourses were occupied by small groups of people for varying lengths of time, during both the course of the seasonal round and in different years; Occupation of camp sites throughout the entire Mount Arthur North area was predominantly sporadic rather than continuous; Occupation, such as focussed camping, likely also occurred along level to very gentle drainage depressions (particularly 1st and 2nd order streams). These water sources were likely to be intermittent and occupation along these lower order streams may only have occurred when standing water was available; Most camp sites involved overnight visits of small hunting parties rather than entire family groups; 	Kuskie 2000

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<ul style="list-style-type: none"> • Other than focused camping, activities engaged in across the survey area involved hunting activities (larger game) by small hunting parties of men, and gathering activities by small parties of women and children, along with transitory movement, procurement of lithic resources, and cultural activities. • The utilisation of areas such as simple slopes, ridge crests, spur crests and minor watercourses was less intense than the valley flats where base camps were situated; • Simple slopes were used during hunting or gathering activities in the course of the normal daily or seasonal round, to access higher ground or stone resources, or to move between camp sites. Ridge and spur crests were also used for these purposes and for accessing vantage points or moving to special ceremonial sites; • Vantage points were important to the Aboriginal occupants of the area, particularly gentle to steep upper slopes adjacent to several ridges, which were mainly accessed by groups of men on hunting expeditions, or for security and/or cultural purposes; • Silcrete and tuff were the preferred stone materials, both of which are locally available and likely procured from local sources during the course of the normal daily or seasonal round, with tuff being the preferred material for manufacture of flaked stone tools; • These materials were also procured from other sources within the region, most notably the alluvial gravels of the nearby Hunter River; • Chert, quartz, petrified wood, chalcedony, and porcellanite were also utilised to a lesser extent and were also procured from local sources, probably during the course of the normal seasonal round; • Silcrete was deliberately heat treated to improve its flaking properties. This may have been undertaken at single locations (e.g., a campsite adjacent to a watercourse) or in different locations reflecting the stages of procurement, heat treatment, reduction and use); • Manufacturing stone tools, particularly flaked implements, was likely a casual or opportunistic activity, conducted on an “as needed” basis; 	

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<ul style="list-style-type: none"> • There was little emphasis on rationing or conservation of the use of most stone materials, due to their wide availability; and • The manufacture of microblades (e.g., hunting spear barbs) was also widely undertaken. While likely a planned and organised activity, it did not necessarily occur at base camps, but may also have occurred in places traversed during the course of hunting expeditions on a more casual or opportunistic basis. 	
Kuskie & Kamminga	2000	Salvage of sites impacted by the construction of the Hunter Expressway, near Black Hill	Black Hill - Woods Gully - Hexham Wetlands Locality, Lower Hunter Valley	<ul style="list-style-type: none"> • The locality was occupied by Aboriginal people of the Pambalong Clan and potentially clans of the broader Awabakal language group; • Occupation focused on wetlands, swamps, lakes, estuaries, the coastline, and potentially also the junctions of multiple resource zones; • Occupation of the area has predominantly occurred within the past 4,000 years; • Occupation may have extended as far back as 30,000 – 40,000 years, but few landscape contexts exist in which archaeological evidence of older occupation would be conserved; • Occupation encompassed the entire region, but at varying intensities, on a seasonal basis, and across different time periods within the overall time-span of occupation; • Seasonal occupation of some resources and localities may not be evidenced in the extant archaeological record; • Occupation of the area reflects a wide range of activities, including transition between locations, hunting, gathering, procurement and utilisation of lithic and other resources, camping, ceremonial and spiritual activities, and burial practices; • Activities conducted and engaged in by the Aboriginal occupants of the area likely included: food procurement, processing, and consumption; production and maintenance of stone and wooden tools and implements; resource procurement; erection of shelters, children's play, ceremonial and spiritual activity, and social and political activity; • Landscape features and variables such as topography, resources, proximity to water, aspect, slope, and cultural preference likely influenced the activities conducted by the Aboriginal occupants of the area; 	Kuskie & Kamminga 2000

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<ul style="list-style-type: none"> • Few of the activities engaged in by past Aboriginal people are likely to be evident within the archaeological record, other than those involving the use of stone or where preservation conditions permit; • Locally available indurated rhyolitic tuff was the preferred material for knapping and stone tool production, followed by silcrete, which was also able to be procured locally in terrace and alluvial gravels; • Both tuff and silcrete were likely obtained during both daily and seasonal movements throughout the landscape on an “as needs” basis, not during “special purpose trips”, and conservation of these materials was not a priority due to their wide availability; • Other locally available stone materials including quartz, quartzite, acidic volcanics, chalcedony and chert were also utilised to a lesser extent; • Non-locally available stone materials such as dacite and rhyodacite (used for grindstones) may have been obtained through trade or exchange with other cultural groups, through special purpose trips, or during visits to other areas during the seasonal round; • Ochre was utilised for ceremonial purposes and may have been procured from sources near Lake Macquarie, the Hunter River, or from outside the region; • Heat treatment of silcrete was undertaken to improve flaking qualities and possibly to obtain desired colours; • A reasonably high proportion of silcrete used in knapping activities was deliberately heat treated, but tuff was not; • Microblade production was a widespread, likely planned and organised, activity with the primary goal of producing microliths (e.g., bondi points) for hunting implements/purposes. • Microblade production may have occurred at both campsites and also in places on transitory routes during hunting expeditions, which may represent more casual or opportunistic behaviour; • Production of microliths was time-consuming and the end result was likely highly desirable and socially valuable; • The investment of time and energy in activities such as heat treatment of silcrete and production of microliths for hunting and fighting spears may 	

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<p>have more social than utilitarian values, as floral and smaller faunal subsistence resources would probably have been most prominent in the economy of the local Aboriginal people.;</p> <ul style="list-style-type: none"> • Casual and opportunistic knapping or selection of flakes to meet requirements on an “as needs” basis was widespread. • A high proportion of knapping products were likely discarded at the site of their manufacture, without use; • Use of bipolar technique was uncommon; • Floral subsistence resources were locally abundant, predominantly obtained and processed by women, and were consumed at campsites and at the site of procurement; • Ferns may have been a staple of the local diet, along with the bulbs and roots of other wetland plants; • Plant preparation sites may include camping places around the margins of Hexham Wetland and other swamps. Tools such as Worimi cleavers were utilised to pound the starch-rich rhizomes of bracken and swamp fern and the roots of other plants obtained from the wetlands; • Eloueras may have been used for extracting the perennial herb cumbungi (<i>Typha australis</i>), abundant in the freshwater parts of wetlands, or less likely, tall spike rush (<i>Eleocharis sphacelata</i>); • Less portable special tools such as Worimi cleavers and grindstones may have been deliberately stored at base camps; • Faunal resources were processed and consumed at temporary hunters or gatherers camps, at nuclear base camps, campsites of larger congregations of people, and at the site of procurement; • Men hunted for larger game, while women played a key role in gathering plants and obtaining smaller game; • Hunting was a planned and coordinated event; • Fish were obtained by several methods, including boating, hooks and lines, spearing, using hand nets, and creating fish traps; • Strategic management of resources such as fish traps was aimed at increasing the reliability and productivity of food resources; 	

Researcher(s)	Year(s)	Project(s)	Area to which the model applies	Summary of model	Reference(s)
				<ul style="list-style-type: none">• Nuclear family base camps may have been strategically positioned in relation to food resources, at the conjunction of two or more subsistence zones, close to potable water, and on level or very gently inclined ground. Visual aspect and security may have also been important considerations;• Site occupants of nuclear family base camps may have foraged within an area of up to 10 km radius from the campsite;• Campsites in more favourable locations may have been subject to more intensive occupation; and• Community base camps or camps of larger congregations of people tended to be situated on level ground adjacent to plentiful food resources and potable water such as river terraces or flats.	

6.2 Local Archaeological Context

6.2.1 AHIMS Database

The AHIMS database, administered by the OEH, contains records of all Aboriginal objects reported to the Secretary of the Department of Premier and Cabinet in accordance with Section 89A of the *National Parks and Wildlife Act 1974*. It also contains information about Aboriginal places that have been declared by the Minister to have special significance with respect to Aboriginal culture. Previously recorded Aboriginal objects and declared Aboriginal places are known as 'Aboriginal sites'.

Searches of the AHIMS database were undertaken on 11 May 2018 for a 20 x 20 km area surrounding the study area resulting in the identification of 1,621 Aboriginal sites, comprising 1,594 open artefact sites (i.e., isolated artefacts and artefact scatters) (18 of which have associated areas of Potential Archaeological Deposit [PAD]), 15 modified trees (two with associated artefacts), five grinding groove sites, four stone quarries, one area of PAD, one midden and one burial (Table 9).

Consideration of the location of previously recorded Aboriginal sites indicates that 231 are located wholly or partially within the study area comprising 227 open artefact sites (i.e., artefact scatter and isolated artefacts), two modified trees and two stone quarries. From these sites, it is noted that the two modified tree sites (AHIMS #37-2-1945 and 37-2-1944) were assessed by Registered Aboriginal Parties (RAPs) and an arborist as not Aboriginal sites as part of the Drayton South Coal Project (AECOM 2012) and updated site cards submitted to the OEH. It is also noted that stone quarry site 'SC-QS-1/Quarry' (AHIMS# 37-2-1955) recorded by Mills (2000) within the study area was not located during AECOM's (2012) assessment or the current assessment.

Taking into account the above issues, a total of 228 Aboriginal sites comprising 227 open artefact sites and one stone quarry are recognised as being located wholly or partially within the study area. Considered of the location of previously recorded sites in relation to project elements indicates the following:

- 23 sites (all open artefact sites) are located wholly or partially within the proposed surface development areas;
- 203 sites (202 open artefact sites and one stone quarry) are located wholly or partially above the proposed underground mining area; and
- two sites (all open artefact sites) are located wholly or partially within both the proposed surface development areas and above the proposed underground mining area.

Table 9 Site search results (20 x 20 km area)

Site Type	Count	%
Open artefact site (i.e., isolated artefacts and artefact scatters)	1,576	97.2
Open artefact site with PAD	18	1.1
Modified tree	13	0.8
Modified trees + artefact	2	0.1
Grinding groove	5	0.3
Stone quarries	4	0.2
PAD	1	0.1
Midden	1	0.1
Burial	1	0.1
Total	1,621	100

Table 10 Sites within the study area

Site Type	Count	%
Open artefact site (i.e., isolated artefacts and artefact scatters)	227	99.6
Stone quarries	1	0.4
Total	228	100

Table 11 Sites by surface development and underground mining

Activity	Open artefact site	Stone quarry	Total	%
Surface development	23	0	23	10.1
Underground mining	202	1	203	89
Surface development and underground mining	2	0	2	0.9
Total	227	1	228	100

In addition to the above sites, on 8 October 2018 AECOM was notified by Scott Franks acting on behalf of the PCWP, that five sites were registered on AHIMS that may be relevant to the Project. AECOM subsequently requested a copy of the site cards from Mr Franks, however was informed that the site cards were restricted. Instead, Mr Franks provided maps showing the site boundaries. AECOM georeferenced the maps and determined that one of the sites was partially located in the north-eastern section of the study area.

In an attempt to gather more information about the sites, AECOM requested a copy of the site cards from the Heritage Information Officer at OEH on 12 October 2018. OEH responded:

“Unfortunately all the Site Cards you have listed below are “Under Investigation” and I won’t be able to release any information relating to them to you. They are also all Restricted, so even if they were not ‘Under Investigation’ as per our normal procedures you would need Aboriginal Community Permission to access them”.

From discussions AECOM has had with Mr Franks for the Project and other developments, it is understood that these sites represent locations where local Aboriginal people lived, sustained a continued connection to Country and include areas where conflict between Aboriginal people and European settlers and police occurred.

AECOM understands that these sites are currently listed on the AHIMS database as ‘not a site’.

6.2.2 Previous Archaeological Investigations within the Study Area

Existing AHIMS data indicates that numerous Aboriginal archaeological investigations incorporating survey and/or test excavation have been undertaken within or directly adjacent to the study since the 1980s. Investigations undertaken directly within the study area include targeted surveys by Dyll (1980), Mills (2000), HLA Envirosiences (2002), Archaeological Risk Assessment Services (2006), and AECOM (2012). Two test excavation programs have been completed in the area including one by Koettig & Hughes (1985) and one by Archaeological Risk Assessment Services (2010). Summaries of these assessments are provided below:

- Dyll (1980) undertook a survey of an area immediately south of the Bayswater Colliery and north of the study area associated with the Maxwell Underground. Three sites, all artefact scatters, were recorded on the banks of Saddlers Creek. The sites contained flakes, cores and backed blades of chert, rhyolite (tuff) and quartz.

- Koettig & Hughes (1985) undertook an archaeological survey of three separate development areas in the Hunter Valley. The areas included the Plashett Reservoir site and water storage area on Saltwater Creek; a coal mine development on Mount Arthur North; and a coal mine development on Mount Arthur South. Within the Plashett Reservoir area, a total of 86 open campsites consisting of stone artefact scatters were recorded. The sites were concentrated along creeklines, especially Saltwater Creek, with artefacts recorded on bare, eroded exposures. Six of these sites were excavated. Within the Mount Arthur South study area, a total of 136 archaeological sites were located and recorded. These comprised 135 open campsites with stone artefact scatters and one site consisting of grinding grooves. The survey focused on areas adjacent to Saddlers Creek. Artefact scatters were the most common site type identified during the survey and were identified eroding out of the A soil horizon. The general pattern of site distribution was one of higher numbers of sites along major creeklines, i.e., Saltwater Creek, with numbers decreasing along tributaries. Artefact densities along the whole of Saddlers Creek were typified by sites of high average densities, with a marked increase in the lower section of the creek. Indurated mudstone/tuff and silcrete were the most frequently recorded raw material. Survey of the Mount Arthur North area resulted in the locating of 93 open campsites consisting of stone artefact scatters. A programme of excavation and collection was carried out. The survey focused on areas adjacent to Whites Creek. Koettig and Hughes (1985) noted that sites tended to correspond in area to the surface exposures in which they were identified. Very few sites were recorded on hill slopes, ridges or along the upper portions of some creeklines where there were large areas of eroded ground.
- Mills (2000) undertook an archaeological survey to identify Aboriginal sites, and areas of potential archaeological sensitivity within the proposed mine and haul road areas for the Saddlers Creek Mine. The focus of the survey was Saddlers Creek; however, a number of its tributaries were also surveyed. Forty Aboriginal sites were identified, including seven isolated artefacts, 29 artefact scatters (nine with PAD), two quarry sites, and two scarred trees. The majority of artefact scatters and isolated finds were identified along ephemeral feeder creeks of Saddlers Creek. Mills (2000) found that evidence of Aboriginal activity was associated with the full length of these creeklines from their headwaters to the floodplain. In addition, at least two sites were identified on ridges and eight sites were identified at least 200 m from creeklines. A total of 238 artefacts were recorded, including 127 (53.4%) flakes, 41 (17.2%) block fracture fragments, 28 (11.8%) cores, 19 (8%) flake fragments, seven (2.9%) scrapers, five (2.1%) manuports, four (1.7%) hammerstones, three (1.3%) backed blades, one sharpening stone, one millstone, one anvil and one pebble axe. Indurated mudstone/tuff was the dominant material (48.32%), followed by silcrete (31.51%), quartzite (5.46%), chert (5.04%), quartz (2.94%), porcellanite (2.10%), siltstone (2.10%), sandstone (0.84%), basalt (0.84%), fossilised wood (0.42%), and glass (0.42%).
- HLA Envirosciences (2002) completed an archaeological survey for the Drayton Mine Extension. A total of 14 artefact scatters were located during survey. Indurated mudstone/tuff was the dominant material (51%), followed by silcrete (39%), quartz (5%) and porcellanite (5%). Artefacts comprised flakes (49%), flaked pieces (41%), cores (9%), and backed blades (1%). All sites were located along creeklines, ridgelines or crests.
- ARAS (2006) undertook an assessment for the Drayton Mine Extension. A total of 480 stone artefacts were recorded from 39 sites that were identified, comprising of 22 artefact scatters and 17 isolated finds. A large proportion of the sites contained fewer than 10 artefacts, though five sites had over 50 artefacts and were associated with drainage lines or gullies. Of the 480 artefacts identified, 38% were complete flakes, 31% broken flakes, 26% flaked pieces and 5% cores. A majority of artefacts were of indurated mudstone/tuff (55%), followed by silcrete (25%), porcellanite (14%) and quartz (4.6%).

- ARAS (2010) undertook a program of salvage excavation for 26 Aboriginal sites for the Drayton Mine Extension. The salvage included surface collection of artefacts at 22 sites, mechanical grader scrapes at 11 locations and hand excavation at three locations. A total of 8,505 artefacts were recovered as part of the works. Of these, 7,500 artefacts were recovered from three distinct knapping locations at Ramrod Creek, identifying the creek as archaeologically sensitive. OSL (optically stimulated luminescence) dating of deposits at Ramrod Creek and Delpah returned dates of 3-1.4 thousand years ago, placing them in the Late Holocene. Raw materials utilised included porcellanite, silcrete, tuff and chert. At Ramrod Creek, porcellanite was the dominant raw material, while at Delpah, silcrete and tuff were dominant. ARAS (2010) proposed that two main site types, reflecting two differing site functions, were present within the study area: fringe sites representing short-term occupation, and sites principally focused on the manufacture of backed artefacts. On the basis of site size (i.e., number of artefacts) and the ratio of discarded tools to waste material, ARAS (2010) proposed that sites adjacent to ridgelines and overlooking ephemeral water systems were the result of 'short term settlement'. Conversely, ARAS (2010) found that sites associated with Ramrod Creek were specific to stone tool manufacturing activities, with particular emphasis on producing Bondi points from porcellanite.

Figure 18 AHIMS Sites

6.3 Archaeological Predictions

A review of the existing archaeological and environmental context of the study area suggests that material evidence of past Aboriginal activity within the area is likely to be restricted to flaked stone artefacts in surface and subsurface contexts. Accordingly, key predictions for the study area's Aboriginal archaeological record are as follows:

- open artefact sites (i.e., artefact scatters and isolated artefacts) will be the dominant site type;
- site types with reasonable potential to occur include scarred trees, stone quarries and grinding grooves;
- site types with limited potential to occur include stone arrangements and burials;
- excluding those portions of the study area that have been grossly disturbed through historical land use activities or severely affected by erosion¹⁴, most areas, irrespective of the presence or absence of associated surface evidence, will contain subsurface archaeological deposits, albeit of highly variable character and extent;
- surface and subsurface artefact distribution within the study area will vary significantly in relation to landform, distance to water and stream order;
- most, if not all, of the Aboriginal archaeological materials present within the study area will be of mid-to-late Holocene antiquity;
- Quaternary alluvial deposits on the Hunter River's contemporary floodplain and its more recent terraces retain the greatest potential for the preservation of early (i.e., late Pleistocene / early Holocene) occupation evidence;
- grinding groove sites, if present, will occur in direct association with watercourses;
- burial sites, if present, will occur in floodplain or terrace contexts;
- the dominant raw material for flaked stone artefact production within the study area will be silicified tuff, with silcrete the second most common material;
- flaked stone assemblages will be dominated by flake debitage items (*sensu* Andrefsky 2005), with formed objects (i.e., cores and retouched flakes) comparatively poorly represented;
- the majority of silcrete artefacts will exhibit evidence of thermal alteration;
- knapping floors, if present, will exhibit evidence indicative of systematic backed artefact manufacture;
- complete and/or fragmentary backed artefacts will dominate the retouched components of recorded flaked stone artefact assemblages; and
- tool types of demonstrated temporal significance, if present, will be limited to edge-ground hatchet heads and backed artefacts.

¹⁴ i.e., complete loss of potential artefact-bearing topsoils

7.0 Archaeological Survey

7.1 Survey

7.1.1 Aim and Objectives

The aim of the archaeological survey was to identify, record and map Aboriginal heritage values within the study area. These values include both the tangible remains of past Aboriginal activity (i.e., archaeological evidence) as well as intangible cultural values. To achieve these aims, the following specific survey objectives were developed:

- to comprehensively survey, by pedestrian transects, land within the study area;
- to identify and record Aboriginal archaeological sites within the study area;
- to inspect, where appropriate, areas of known or potential Aboriginal cultural value, including AHIMS sites and areas identified by RAP representatives; and
- to obtain sufficient data to facilitate the development of appropriate management and mitigation measures for identified Aboriginal sites and areas of archaeological sensitivity.

7.1.2 Methodology

A field team of two AECOM heritage specialists (Geordie Oakes and Dr Darran Jordan) and RAP representatives completed the archaeological survey of the study area over nine days including 15-17 and 20-24 August 2018 and 24 October 2018. As noted in Section 3.0, the project methodology issued to RAPs on 19 July 2018 indicated that archaeological survey was proposed within those portions of the study area not previously surveyed as part of the Drayton South Coal Project (AECOM 2012). Combined with the AECOM (2012) survey, which ran over 26 days, the current survey resulted in full survey coverage of the study area.

All survey for the previous survey and the current survey was conducted on foot, with a total of 17 transects executed across the study area for the current field program. Participants in the survey (on average eight participants per day) were spaced at 10 m intervals during the survey. The location of each transect completed during the survey, including start and end points, was recorded using one of two handheld differential GPS units, with associated transect data (e.g., GSV and GI ratings) entered directly into the same unit upon the completion of each transect.

7.1.3 Site Definition

The definition, in spatial terms, of Aboriginal archaeological sites is a topic of considerable importance to modern cultural heritage management, and is one that has generated significant discussion in Australian archaeology (e.g., Doleman 2008; Holdaway 1993; Holdaway et al. 1998, 2000; MacDonald & Davidson 1998; McNiven 1992; Robins 1997; Shiner 2008). Aboriginal archaeological sites can be broadly defined as places in the landscape that retain physical evidence of past Aboriginal activity. Such evidence, of course, can assume a range of forms, depending on the nature of the activity or activities that produced it, and can vary dramatically in quantity and extent. Some Aboriginal archaeological sites are, by their very nature, easy to define in spatial terms, with scarred trees and rockshelters, for example, readily distinguishable from their surrounding landscapes. Difficulties arise, however, for sites whose present-day physical extent is, more often than not, a product of geomorphic processes, as opposed to the actions of Aboriginal people in the past.

Although relevant to a variety of site types, geomorphic processes such as soil erosion and aggradation, are of particular relevance to identification and definition of surface scatters of stone artefacts, commonly referred to as 'open camp-sites' or 'artefact scatters'. It is, for example, now widely accepted that the archaeological visibility of such sites is, in most instances at least, entirely dependent on the operation of such processes, which will have acted variously to expose, conceal or remove completely associated archaeological materials (Dean-Jones & Mitchell 1993; Fanning et al. 2008, 2009; Shiner 2008). As demonstrated by countless large-scale excavation projects in south-eastern Australia, surface artefacts invariably represent only a fraction of the total number of artefacts present within these sites, with the majority occurring in subsurface contexts.

Artefact exposure, unsurprisingly, is highest on erosional surfaces and lowest on depositional ones. At the same time, in many areas, surface artefacts have been shown to form part of more-or-less continuous subsurface distributions of artefacts, albeit with highly variable artefact densities linked to environmental variables such as stream order and landform.

Such evidence poses a significant analytical and interpretive dilemma. Defining sites on the basis of surface artefacts alone is clearly problematic, with modern site boundaries invariably reflecting the size and distribution of surface exposures as opposed to the actions of Aboriginal people in the past. Nonetheless, for pragmatic reasons, this is the most commonly used approach, with 'distance' and 'density-based' definitions dominating. In NSW, two of the most commonly employed distance-definitions are '*two artefacts within 50 m of each other*' and '*two artefacts within 100 m of each other*'. Neither definition is derived from a particular theoretical approach or body of empirical research - they are simply pragmatic devices for site definition. Definitions based on artefact density also vary in their particulars. However, one of most commonly used definitions is that which isolates, within an arbitrarily defined 'background scatter' of one artefact/100 m², higher density clusters that are subsequently defined as 'sites'.

Non-site or distributional archaeology offers an alternative approach to distance and density-based site definitions (Ebert 1992; Foley 1981), with individual artefacts, not sites, treated as the basic units of analysis (for published Australian examples see Doelman 2008; Holdaway et al. 2000; McNiven 1992; Robins 1997; Shiner 2008). While recognising the interpretive potential of non-site approaches with respect to data analysis and discussion, their implementation in the context of cultural heritage management studies is difficult. Here, the identification of 'sites' is required for reasons of recording (i.e., their entry into site databases such as AHIMS) as well as ease of relocation, protection, and ongoing management. The identification of spatially-discrete 'sites', therefore, offers the most pragmatic approach to Aboriginal heritage management in impact assessment contexts (but see McDonald 1996 for a different approach).

For this assessment, the '*two artefacts within 100 m of each other*' definition has been adopted.

7.2 Survey Results

7.2.1 Survey Coverage and Effective Coverage

As indicated in Section 7.1.2 and shown on Figure 19, a total of 17 pedestrian transects were completed over the study area for the current field program (in addition to the 46 transects undertaken as part of the AECOM [2012] surveys). While all parts of the study area and all landforms were investigated, recorded transect data indicate that a total survey coverage, when combined with the AECOM (2012) survey, of approximately 2,269 ha of the total study area of 2,343 ha (i.e., 96.8%) was achieved.

Effective coverage is an estimate of the area in which archaeological materials are 'detectable' and is determined through estimating the visibility and exposure of each transect to calculate an effective coverage percentage. Effective coverage estimates for each transect completed during the current survey, shown in Table 12, are, for the most part good, with 11 exceeding 10%. Ground Surface Visibility (GSV) across the study area was average, ranging from 20%-90%¹⁵. Areas of enhanced GSV comprised erosion exposures, ploughed fields and along access tracks. Calculation of the total effective coverage achieved for the current survey indicates that around 15.9% (c.88 ha) of the survey area could be effectively surveyed for surface Aboriginal archaeological materials.

Effective coverage estimates for transects completed during the current survey, combined with those completed within the study area as part of the AECOM (2012) surveys, suggest overall effective coverage of the study area was good with a total of 15.9 % effective survey coverage achieved for the current survey and 11.1 % was achieved for the past Drayton South Coal Project area.

¹⁵ The *Code of Practice for Archaeological Investigation of Aboriginal Objects in New South Wales* (DECCW 2010b) describes visibility as "Visibility is the amount of bare ground (or visibility) on the exposures which might reveal artefacts or other archaeological materials"

Table 12 Effective coverage data for the current survey

Survey Unit	Landform Units	Survey Unit Area (ha)	Visibility %	Exposure %	Effective coverage of the Survey Area (ha)	Effective coverage of the Survey Area %

7.3 Surface Artefacts

7.3.1 Current Archaeological Survey

A total of 545 individual stone artefacts were recorded during the current archaeological survey (Appendix K). A simplified typological breakdown of the recorded assemblage (Table 13) shows that the assemblage is dominated by flake debitage items (76.5%) comprising complete flakes (n=242, 44.4%), flake shatter (n=150, 27.5%), proximal flakes (n=17, 3.1%) and split flakes (n=8, 1.5%). Non-flake debitage items (i.e., angular shatter) make up the next largest portion of the assemblage (n=73, 13.4%).

Formed objects (i.e. tools, cores) make up the remainder of the assemblage with retouched flakes (n=4, 0.7%), complete and broken cores (n=40, 7.3%), axes (n=9, 1.6%) and choppers (n=2, 0.4%). The most common raw material recorded was silicified tuff (n=369, 67.9%), followed by silcrete (n=116, 21.1%), chert (n=17, 3.1%), quartz (n=14, 2.6%), porcellanite (n=9, 1.7%), basalt (n=6, 1.1%), FGS other (n=8, 1.5%), quartzite (n=5, 0.9%), and volcanic (n=1, 0.2%).

Recovered artefacts were generally medium sized, with an average maximum linear dimension of 33.1±19.8 mm (range: 6.5-141 mm) (Table 14).

Identified cores include 28 unidirectional, 10 multidirectional and one bidirectional cores manufactured on varying blanks (i.e., cobbles, flakes etc.).

Cortex is moderately well represented in the survey assemblage, with 42 artefacts retaining cortex at discard.

Nine axes, three broken and three exhibiting ground surfaces, were recorded in the assemblage with basalt being the common raw material utilised. Two large chopping tools were also recorded.

When combined with artefact data obtained as part of the AECOM (2012) surveys a total of approximately 4,018 surface artefacts have been identified within the study area. A simplified typological breakdown of artefacts, where detailed data was recorded, is provided below. As shown, raw materials and typologies are consistent with those identified as part of the current assessment.

Table 15 Simplified typological breakdown of artefacts

7.4 Sites

A total of 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry have been identified within the study area¹⁶ (Figure 21). These include:

- 228 previously recorded AHIMS sites; and
- 47 new sites recorded during the current survey.

The 47 new Aboriginal archaeological sites recorded within the study area during the current assessment all comprised open artefact sites. Site details are provided in Table 16 below with their locations shown on Figure 21 and site cards provided in Appendix L.

Table 16 Aboriginal archaeological sites within the study area recorded by AECOM 2019

37-2-5847	MP-AS28-18	301932	6414599	Artefact scatter
37-2-5862	MP-AS29-18	299070	6409642	Artefact scatter + PAD

7.4.1 Open Artefact Sites

A total of 274 open artefact sites (i.e., artefact scatters and isolated artefacts) of various sizes and artefact densities were identified within the study area. These include 227 previously recorded open artefact sites and 47 new sites recorded as part of the current assessment. Together, these sites contained 4,018 stone artefacts. Artefact scatters (n=27) and isolated artefacts (n=20) were more-or-less equally represented within the study area representing 57% and 43% of the total of new sites respectively. Of the 27 artefact scatter sites, four have associated areas of PAD.

7.4.2 Stone Quarries

Two stone quarry sites have been previously identified within the study area, both by Mills (2000). These include AHIMS registered sites 'SC-QS-2' (AHIMS #3-37-2-1954) and 'SC-QS-1' (AHIMS #37-2-1955). Reference to the site card for SC-QS-2 indicates this site covers an area of approximately 500 m² and comprises numerous silcrete, chert, mudstone and quartzite cobbles/boulders scattered across a wide area. The site card notes evidence of use includes the presence of a large number of cores and flakes, both primary and secondary. AECOM's inspection of the area likewise identified a large number of silcrete and chert cobbles/boulders dispersed over a large area. However, AECOM found the number of artefacts associated with the cobbles/boulders was relatively small with only a handful identified. It was concluded that while the site meets the broad definition of what constitutes a quarry (i.e., "the location of an exploited stone source" [Hiscock & Mitchell 1993]) evidence of on-site reduction was limited. As discussed in Section 6.1.4, researchers in the Hunter Valley have contended that evidence of quarrying at gravel sources will tend to produce a low density background scatter of flakes and flaked cobbles that are the results of assaying (and cobble rejection) through to high densities associated with systematic reduction activities (i.e., flaking and heat shattering of stone) (Jones & White, 1988; White 1998; Moore 2000). In relation to site SC-QS-2, the former (i.e., assaying) is more consistent with evidence observed at the site. The primary activity likely to have taken place onsite is raw material selection with limited on-site reduction, and selected material potentially transported elsewhere for reduction.

Reference to the site card for SC-QS-1 indicates the site covers an area of 150 m x 30 m with cobbles/boulders of mudstone, silcrete, chert, fossilised wood and river pebbles having been identified. Despite several attempts, AECOM was unable to locate the cobbles/boulders described in the site card in the vicinity of the registered site location. The description provided by Mills (2000) of the site contains no information of the number and types of artefacts located at the site. However, photographs of artefacts identified at the site are provided in the report (Mills 2000). As SC-QS-1 was not located, the site has not been included in the archaeological survey results. However, potential impacts to SC-QS-1 have been considered in Section 9.

7.5 Spatial Distribution

The distribution of Aboriginal archaeological materials within any given landscape can be assessed from two analytical positions. The first, known as a site-based approach, utilises the 'site' as the basic unit of analysis whilst the second, referred to as a non-site approach, utilises the individual artefact as the unit of analysis.

The non-site approach is employed here as a means of assessing the relationship of recorded artefacts to the environmental variables of distance to water and landform.

7.5.1 Distance to Watercourse

The proximity and permanency of potable water sources are routinely cited as key determinants of Aboriginal settlement patterns. Accordingly, Table 17 tabulates the relationship of these variables to recorded artefact locations as part of the current assessment. In terms of distance to water, as indicated, the highest count of artefacts were identified within the 0-100 m distance range (68.8%, n = 375) followed by the 101-200 m range (22.8%, n=124), 201-300 m, (5%, n=27), 301-400 m, (2.8%, n=15), 401-500 m, (0.3%, n=2) and 501-600 m, (0.3%, n=2) demonstrating a clear trend of lower artefact counts as distance from creekline increases.

The majority of artefacts were associated with 1st order creeklines (62.8%, n=342). Nonetheless, 1st order creeklines within the study area are unlikely to have been a source of permanent potable water, unlike 3rd and 4th order streams.

Table 17 Relationship between watercourses distance/stream order and artefact counts (current assessment)

Distance to Water Source (m)	Creekline Order			Total	% of Total
	1	2	3		
0 – 100	248	127	0	375	68.8
101 – 200	60	62	2	124	22.75
201 – 300	21	3	3	27	4.95
301 – 400	10	2	3	15	2.75
401 – 500	2	0	0	2	0.37
501 – 600	1	0	1	2	0.37
Total	342	194	9	545	100
% of Total vs. Stream Order	62.8	35.6	1.7		

When combined with artefacts recorded within the study area as part of the AECOM (2012) surveys, distance to watercourse percentages largely mirror results from the current assessment. The highest count of artefacts was identified within the 0-100 m distance range (79%, n = 3192) followed by the 101-200 m range (15.2%, n=612), 201-300 m, (2.9%, n=116), 301-400 m, (1.6%, n=65), 401-500 m, (0.7%, n=28) and 501-600 m, (0.1%, n=5) demonstrating a clear trend of lower artefact counts as distance from creekline increases.

Table 18 Relationship between watercourses distance/stream order and artefact counts (combined)

Distance to Water Source (m)	Creekline Order			Total	% of Total
	1	2	3		
0 – 100	1880	1104	208	3192	79.44
101 – 200	309	227	76	612	15.23
201 – 300	82	30	4	116	2.89
301 – 400	58	4	3	65	1.62
401 – 500	26	0	2	28	0.70
501 – 600	4	0	1	5	0.12
Total	2359	1365	294	4018	100
% of Total vs. Stream Order	58.71	33.97	7.32		

7.5.2 Landform Analysis

Examination of the distribution of recorded artefacts in relation to landform indicates a trend towards higher artefact counts on lower slopes (62.2%, n=339) followed by flats (17.8%, n=97).

Table 19 Artefact distribution in relation to landform (current assessment)

Landform Type	No. of Artefacts	%
Crest	22	4.04
Upper slope	16	2.94
Middle slope	71	13.03
Lower slope	339	62.20
Flat	97	17.80
Total	545	100

When combined with artefacts recorded within the Maxwell study area as part of the AECOM (2012) surveys, distribution of artefacts in relation to landform likewise indicates a trend towards higher artefact counts on lower slopes (47.01%, n=1,889) followed by flats (30.96%, n=1,244).

Table 20 Artefact distribution in relation to landform (combined)

Landform Type	No. of Artefacts	%
Crest	60	1.49
Upper slope	63	1.57
Middle slope	682	16.97
Lower slope	1889	47.01
Flat	1244	30.96
Disturbed	80	1.99
Total	4018	100

7.6 Archaeological Sensitivity: Subsurface Archaeological Potential

Subsurface archaeological potential is addressed in the context of this assessment by the concept of 'archaeological sensitivity'. Figure 22 provides archaeological sensitivity mapping based on four key factors including the nature and extent of visible surface artefacts across the study area, a review of the findings of previous archaeological investigations in analogous landforms in the surrounding area, on-site observations of post-depositional processes and historic ground surface disturbances. Using these variables, the level of archaeological sensitivity has been graded into three categories: nil, low and high. These ratings have then been applied to the study area to assess levels of potential subsurface deposit.

As shown on Figure 22, much of the study area has been assessed as being of low archaeological sensitivity. Areas of low sensitivity have been associated with areas of middle and upper slope within the study area with fewer artefacts identified within these areas. Areas of high archaeological sensitivity have been linked to flats, lower slopes, crests and creeklines, and areas where surface artefacts have been identified in quantities considered greater than 'background scatter'. Areas of nil archaeological sensitivity are associated with areas of gross disturbance.

Relative to areas of low sensitivity, it is predicted that subsurface archaeological deposits located within areas of high sensitivity will exhibit higher mean artefact counts, densities and assemblage richness values (i.e., with respect to the representation of technological types and raw materials). Archaeological features such as knapping floors and hearths are also more likely to occur in these areas.

Areas of 'nil' archaeological sensitivity within the study area comprise those that have been grossly disturbed by modern and/or historic European land use practices. Aboriginal archaeological materials are unlikely to survive in these areas.

Regarding the validity or accuracy of the sensitivity ratings, it should be noted that sensitivity mapping has been undertaken on a broad-scale and significant variation in artefact densities/complexity within areas of identified archaeological sensitivity is considered likely. Sensitivity mapping is provided to guide management of the study area's archaeological resource and would be managed as part of the ACHMP.

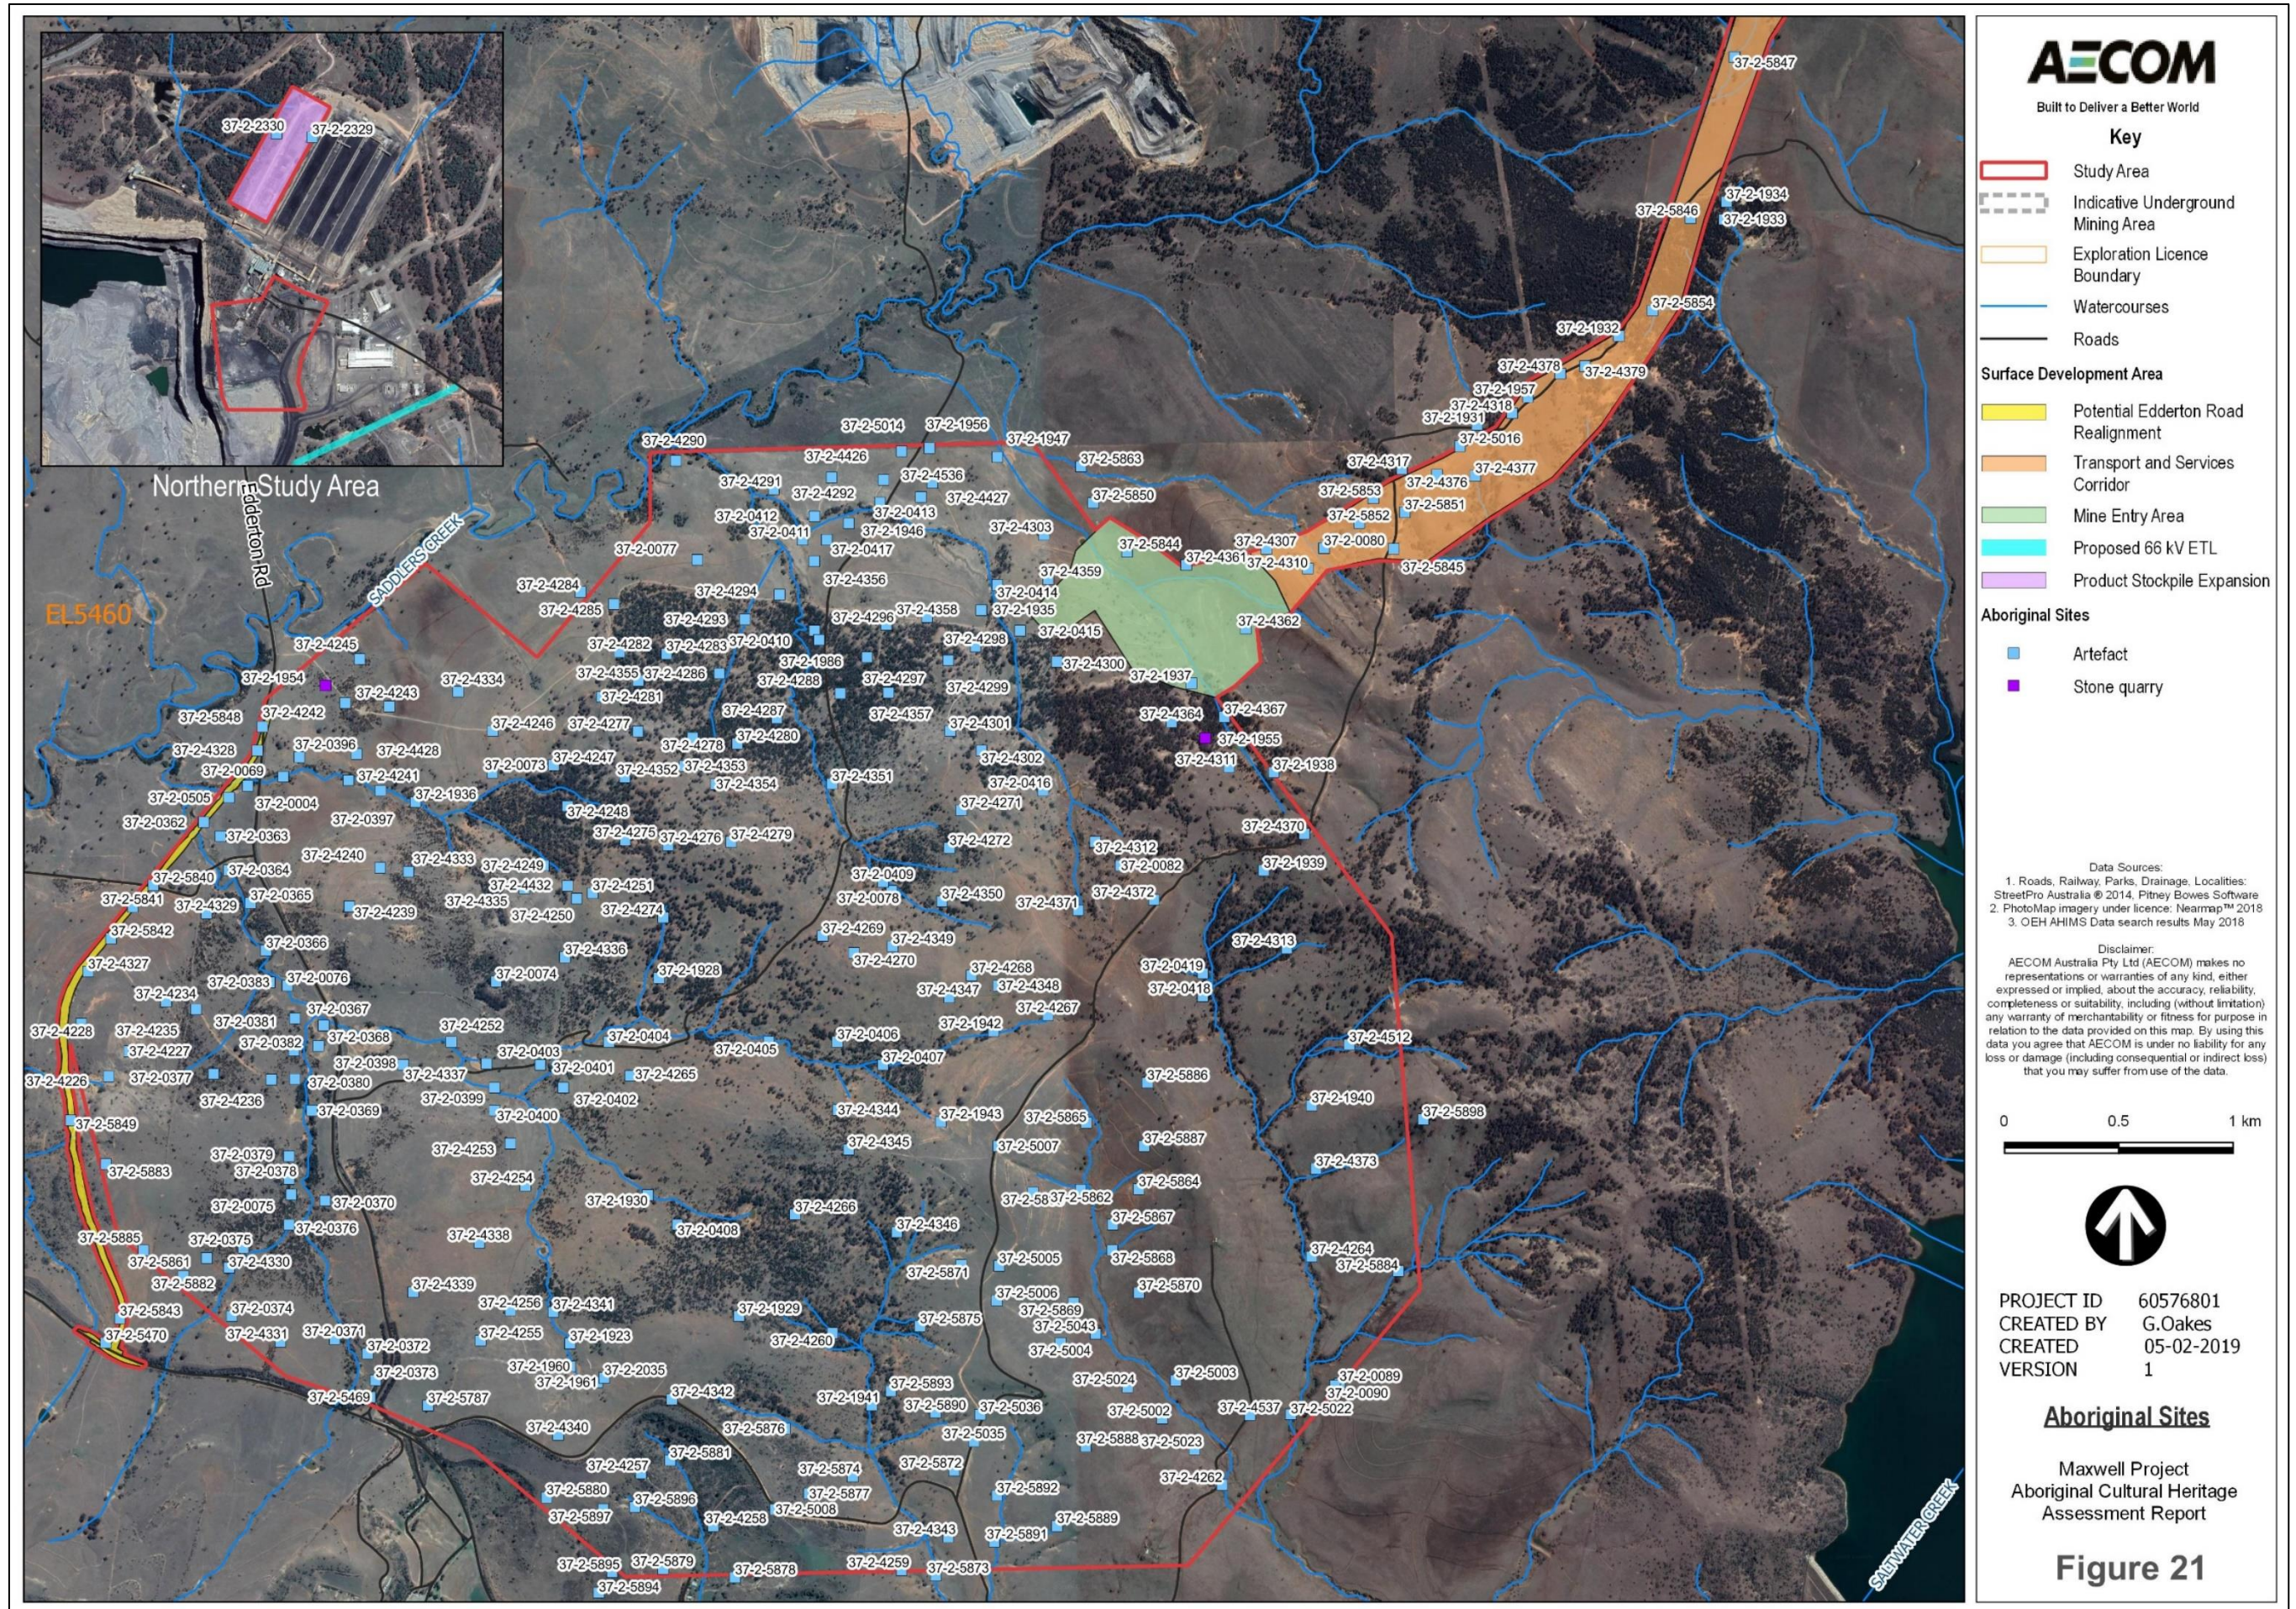

Figure 22 Archaeological Sensitivity

7.7 Evaluation of Predictive Model

Table 21 provides an evaluation of the predictive model provided in Section 6.3.

Table 21 Evaluation of Predictive Model

Prediction	Survey Result
Open artefact sites (i.e., artefact scatters and isolated artefacts) will be the dominant site type	The results of the assessment support this prediction.
Site types with reasonable potential to occur include scarred trees, stone quarries and grinding grooves	The results of the assessment support this prediction.
Site types with limited potential to occur include stone arrangements and burials	The results of the assessment support this prediction.
Excluding those portions of the study area that have been grossly disturbed through historical land use activities or severely affected by erosion ¹⁷ , most areas, irrespective of the presence or absence of associated surface evidence, will contain subsurface archaeological deposits, albeit of highly variable character and extent	Previously completed archaeological investigations incorporating test excavation within and adjacent to the study area support this prediction.
Surface and subsurface artefact distribution within the study area will vary significantly in relation to landform, distance to water and stream order	The results of the assessment support this prediction.
Most, if not all, of the Aboriginal archaeological materials present within the study area will be of mid-to-late Holocene antiquity	The results of the assessment support this prediction.
The dominant raw material for flaked stone artefact production within the study area will be silicified tuff and/or silcrete	The results of the assessment support this prediction.
Flaked stone artefact assemblages will be dominated by flake and non-flake debitage items (<i>sensu</i> Andrefsky 2005), with formed objects (i.e., cores and retouched implements) comparatively poorly represented	The results of the archaeological survey support this prediction.
Raw material sources suitable for knapping are likely to be present within the study area and may be associated with the Hunter River	The results of the archaeological survey support this prediction.
Tool types of demonstrated chronological significance will be restricted to backed artefacts and/or edge-ground hatchet heads	The results of the archaeological survey support this prediction.
Complete and/or fragmentary backed artefacts will dominate the retouched components of recorded flaked stone artefact assemblages	The results of the archaeological survey support this prediction.
The majority of silcrete artefacts will exhibit evidence of thermal alteration	The results of the archaeological survey support this prediction.
Scarred trees may occur where original remnant vegetation remains	The results of the archaeological survey support this prediction.

¹⁷ i.e., complete loss of potential artefact-bearing topsoils.

7.8 Summary of Results

A summary of the key findings of the program of archaeological survey undertaken within the study area is provided below:

- A total of 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry have been identified within the study area. These include 228 previously recorded AHIMS sites and 47¹⁸ new sites recorded during the current survey.
- A total of 545 individual stone surface artefacts were recorded during the archaeological survey. The assemblage is dominated by flake debitage items (76.5%) comprising complete flakes (n=242, 44.4%), flake shatter (n=150, 27.5%), proximal flakes (n=17, 3.1%) and split flakes (n=8, 1.5%). Non-flake debitage items (i.e., angular shatter) make up the next largest portion of the assemblage (n=73, 13.4%). Formed objects (i.e. tools, cores) make up the remainder of the assemblage with retouched flakes (n=4, 0.7%), complete and broken cores (n=40, 7.3%), axes (n=9, 1.6%) and choppers (n=2, 0.4%).
- The most common raw material recorded was silicified tuff (n=369, 67.9%), followed by silcrete (n=116, 21.1%), chert (n=17, 3.1%), quartz (n=14, 2.6%), porcellanite (n=9, 1.7%), basalt (n=6, 1.1%), FGS other (n=8, 1.5%), quartzite (n=5, 0.9%), and volcanic (n=1, 0.2%).
- Combined with the results of the AECOM (2012) a total of approximately 4,018 surface artefacts have been identified within the current study area.
- An Aboriginal stone quarry site comprising a naturally occurring outcrop of silcrete cobbles has been identified within the study area (37-2-1954).
- The majority of surface artefacts (79.4%, n=3,192) were identified within 100 m of a watercourse.
- The majority of surface artefacts (58.7%, n=2,359) were identified associated with a 1st order watercourse.
- The largest counts of surface artefacts (47.01%, n=1,889) were identified on the lower slope landform followed by flats (30.96%, n=1,244).

7.9 Discussion

As indicated in Section 7.1.1, the overarching objective of the survey undertaken for the current investigation was to collect information about the nature and extent of surface Aboriginal objects across the study area and to assess levels of subsurface archaeological sensitivity. The results of this the assessment are discussed below.

The current investigation has enhanced our understanding of Aboriginal site patterning and occupation on a local scale and has provided an important dataset for guiding the management of the study area's known and potential Aboriginal archaeological resource. Environmental and archaeological biases notwithstanding, the identification of numerous Aboriginal archaeological sites within the study area attests to a widespread Aboriginal presence in the past.

While acknowledging issues surrounding ground surface visibility across the study area, the overall pattern of surface artefact distribution revealed during the survey is one suggestive of variability in Aboriginal use of the study area with an emphasis on the utilisation of land adjacent to creeklines (i.e., creek flats and lower slopes) in all parts of the study area. Densities of artefacts across the area range from what Douglas and McDonald (1993) have described as "background scatter", being "artefactual material which is insufficient in number or in association with other material to suggest focussed activity in a particular location", and might reasonably be interpreted as products of small-scale or limited episodes of lithic discard (*sensu* Jo McDonald CHM, 2005: 129-30) to higher densities indicating knapping events associated with longer term usage or multiple visitations.

¹⁸ Note, six additional sites were recorded outside the study area during the archaeological survey (37-2-5895, 37-2-5894, 37-2-5898, 37-2-5850, and 37-2-5873, 37-2-5863)

The Hunter River and Saddlers Creek, in particular, would have been focal resource areas for Aboriginal people occupying the study area and greater Muswellbrook area more broadly, facilitating sustained and/or intensive occupation over thousands of years. Collectively, the character of the flaked stone artefact assemblages associated with newly and previously identified open artefacts adjacent to these watercourses are suggestive of what Shiner (2008), following Schlanger (1992), has described as a 'persistent place'. Persistent places, as articulated by Schlanger (1992), are created through two basic mechanisms, the first being when a particular landscape segment possesses a quality that attracts repeated human activity over time, for example, a watercourse or knappable stone source, the second, being the structuring¹⁹ of future landscape use through human creations and/or environmental modifications. Such places may be functionally dynamic through time and need not attract permanent settlement, the alternative being long-term episodic use.

In common with other local stone artefact assemblages, both surface recorded and excavated, the cultural lithic assemblage identified across the study area attests to an emphasis on the procurement and reduction of both local and non-local lithic raw materials, principally locally sourced silicified tuff and silcrete, but also other materials such as FGS (local), quartz (local), quartzite (local) and porcellanite (non-local). The presence of an Aboriginal stone quarry site, consisting of naturally occurring outcrop of silcrete and chert cobbles within the study area (37-2-1954) (impacts avoided by the Project - Section 9), suggests that Aboriginal people may have visited the area for the purpose of obtaining and utilising this resource. The presence of thermally altered artefacts and heat shatters within the assemblage, meanwhile, is suggestive of two processes: unintentional post-discard burning and deliberate heat treatment to improve flaking quality. Both phenomena are well represented in the archaeological record of the Hunter Valley.

Backed artefacts, many of which have been identified within the study area, are a near-ubiquitous element of the stone artefact record of the Hunter Valley and likely served as multifunctional tools in pre-contact times, with existing residue and use-wear data for this implement type (e.g., McDonald et al. 2007; Fullagar et al. 2009; Robertson et al. 2009; Robertson 2011) suggesting that they typically served as elements in flexible, multi-functional composite tools used variously for cutting, incising and drilling plant and animal materials, as well as projectile use. In south-eastern Australia, backed artefacts are known to have been produced as early as 8,500 years BP (Attenbrow & Hiscock 1998). However, between c.3500 BP and 1500 BP, they were manufactured and discarded in large quantities across numerous sites - the so called "backed artefact proliferation event" (Hiscock 2002). Research into this phenomenon, spearheaded by Hiscock (1994, 2002), has identified the onset of an El Niño Southern Oscillation (ENSO)-dominated climatic pattern 4,000 to 5,000 years ago as a key causal trigger, with increased backed artefact manufacture interpreted as one of number of technological strategies employed by Aboriginal people to reduce subsistence risks incurred by increased climatic variability.

In the absence of absolute dates obtained through controlled archaeological excavation and/or a detailed geoarchaeological investigation, establishing a chronological context for the identified surface Aboriginal archaeological resource of the study area is difficult. As in other contexts (e.g., Fanning et al. 2008, 2009; Shiner 2008), establishing the temporal history of the various soil units present within the study area will prove crucial to ascertaining the antiquity of the Aboriginal archaeological materials within it, both in surface and subsurface contexts. In view of the now well documented difficulties associated with the dating of detrital charcoal from the heavily bioturbated A soil horizons of texture contrast soil profiles (e.g., Dean-Jones & Mitchell 1993), the identification and dating of features of undoubted or probable anthropogenic origin (e.g., hearths, heat treatment pits) will likewise prove critical.

¹⁹ Through re-use or avoidance.

Although limited in respect to the chronological resolution that it offers, the technological and typological character of the stone artefact assemblage identified during survey offers some insight into the antiquity of Aboriginal occupation within the study area. As highlighted in Section 6.1, McCarthy's (1967) ERS of stone artefact assemblages remains, with some modification, the dominant chronological framework for Aboriginal occupation of the Hunter Valley. Based on appreciable changes in the composition of chipped stone artefact assemblages over time, the ERS hypothesises a three phase sequence of 'Capertian' (earliest), 'Bondaian' and 'Eloueran' (most recent) assemblages and was developed on the basis of McCarthy's (1948, 1964) pioneering analyses of stratified chipped stone assemblages from Lapstone Creek rockshelter, on the lower slopes of the Blue Mountains eastern escarpment, and Capertee 3 rockshelter in the Capertee Valley north of Lithgow. At present, the most widely cited characterisation of the ERS is that of a four-phase sequence beginning with the Pre-Bondaian (McCarthy's Capertian) and moving successively through the Early, Middle and Late phases of the Bondaian, the last of which equates to McCarthy's (1967) Eloueran phase. The tripartite division of the Bondaian is based principally on the presence/absence and relative abundance of backed artefacts (Attenbrow 2010: 101). However, other factors, such as changes in the abundance of bipolar artefacts and different stone materials, and the presence/absence of edge-ground hatchet-heads are also relevant.

While acknowledging the interpretive difficulties posed by the so-called 'palimpsest problem', technological and typological affinities between the stone artefact assemblage identified during the current survey (which includes both Bondi points and edge-ground hatched heads/axes) and other Hunter Valley assemblages, some of which have associated radiometric dates, are suggestive of a broad Middle to Late Bondaian date (i.e., 4000 BP to European contact).

8.0 Significance Assessment

8.1 Principles of Assessment

Heritage sites hold value for different communities in a variety of different ways. All sites are not equally significant and thus not equally worthy of conservation and management (Pearson & Sullivan 1995: 17). One of the primary responsibilities of cultural heritage practitioners, therefore, is to determine which sites are worthy of preservation and management (and why) and, conversely, which are not (and why) (Smith & Burke 2007: 227). This process is known as *the assessment of cultural significance* and, as highlighted by Pearson and Sullivan (1995: 127), incorporates two interrelated and interdependent components. The first involves identifying, through documentary, physical or oral evidence, the elements that make a heritage site significant, as well as the type(s) of significance it manifests. The second involves determining the degree of value that the site holds for society (i.e., its cultural significance) (Pearson & Sullivan 1995: 126).

In Australia, the primary guide to the assessment of cultural significance is the *Australian ICOMOS Charter for Places of Cultural Significance* (2013), informally known as *The Burra Charter*, which defines cultural significance as the “aesthetic, historic, scientific, social or spiritual value for past, present or future generations” of a site or place (ICOMOS 2013: 2). Under the Burra Charter model, the cultural significance of a heritage site or place is assessed in terms of its aesthetic, historic, scientific and social values, none of which are mutually exclusive (Table 22). Establishing cultural significance under the Burra Charter model involves assessing all information relevant to an understanding of the site and its fabric (i.e., its *physical* make-up). The assessment of cultural significance and the preparation of a statement of cultural significance are critical prerequisites to making decisions about the management of any heritage site or place (ICOMOS 2013: 2).

With respect to Aboriginal heritage, it is possible to identify two major streams in the overall significance assessment process: the assessment of *scientific value(s)* by archaeologists and the assessment of *social (or cultural) value(s)* by Aboriginal people. Each is considered separately below.

Table 22 Values relevant to determining cultural significance, as defined by The Burra Charter (ICOMOS 2013)

Value	Definition
Aesthetic	“Aesthetic value includes aspects of sensory perception for which criteria can and should be stated. Such criteria may include consideration of the form, scale, colour, texture and material of the fabric; the smells and sounds associated with the place and its use” (ICOMOS 2013).
Historic	“Historic value encompasses the history of aesthetics, science and society...[a] place may have historic value because it has influenced, or has been influenced by, an historic figure, event, phase or activity. It may have historic value as the site of an important event” (ICOMOS 2013).
Scientific	“The scientific or research value of a place will depend on the importance of the data involved, on its rarity, quality or representativeness, and on the degree to which the place may contribute further substantial information” (ICOMOS 2013).
Social	“Social value embraces the qualities for which a place has become a focus of spiritual, political, national or other cultural sentiment to a majority or minority group” (ICOMOS 2013).

8.2 Scientific Value

Scientific value refers to the importance of a place in terms of its rarity, representativeness and the extent to which it may contribute further information (i.e., its research potential) (OEH 2011: 9).

8.2.1 Rarity and Representativeness

Rarity and representativeness are related concepts. Rarity refers to the relative uniqueness of a site within its local and regional context. The scientific significance of a site is assessed as higher if it is unique or rare within either context. Conversely, it is considered to be of lower significance if it is common in one or both. The concept of representativeness, meanwhile, refers to the question of whether or not a site is “a good example of its type, illustrating clearly the attributes of its significance” (Burke & Smith 2004: 247). Representativeness is an important criterion as one of the primary goals of cultural heritage management is to preserve for future generations a representative sample of all archaeological site types in their full range of environmental contexts.

In common with rarity, assessments of representativeness within a region are dependent on the state of current knowledge concerning the number and type of archaeological sites present within that region²⁰. This is a critical point, for as suggested by Kuskie (2000) and others (e.g., Bowdler 1981; Godwin 2011; Pearson & Sullivan 1995), the absence across most of Australia of regional-scale quantitative data for Aboriginal sites and places represents a major constraint in assessments of representativeness and rarity. As stressed by Bowdler (1981) some 30 years ago, detailed regional-scale assessments of the Aboriginal archaeological record of Australia are required to address this issue.

8.2.2 Research Potential

Research potential can be defined as the potential of an archaeological site to address what Bowdler (1981: 129) has referred to as “timely and specific research questions”. These questions may relate to any number of issues concerning past human lifeways and environments and, as suggested by Bowdler’s quote, will inevitably reflect current trends or problems in academic research (Burke & Smith 2004: 249). For their part, Bickford and Sullivan (1984: 23-4) suggest that the research potential of an archaeological site can be determined by answering the following series of questions:

1. Can the site contribute knowledge which no other resource can?
2. Can the site contribute knowledge which no other such site can?
3. Is this knowledge relevant to general questions about human history or other substantive subjects?

Several criteria can be used to assess the research potential of an archaeological site. Particularly important in the context of Aboriginal archaeology are the intactness or integrity of the site in question, its complexity and its potential for archaeological deposit (NSW National Parks and Wildlife Service 1997: 7). The connectedness of the site to other sites or natural landscape features may also be relevant.

Integrity refers to the extent to which a site has been disturbed by natural and/or anthropogenic phenomena and includes both the state of preservation of particular remains (e.g., animal bones, plant remains) and, where applicable, stratigraphic integrity. Assessments of archaeological integrity are predicated on the notion that undisturbed or minimally disturbed sites are likely to yield higher quality archaeological and/or environmental data than those whose integrity has been significantly compromised by natural and/or anthropogenic phenomena. Establishing levels of preservation or integrity in the context of a surface survey is difficult. Nonetheless, useful rating schemes are available for ‘open’ sites (Coultts & Witter 1977: 34) and scarred trees (Long 2003).

The *complexity* of a site refers primarily to the nature or character of the artefactual materials or features that constitute it but also includes site structure (e.g., the physical size of the site, spatial patterning in observed cultural materials). In the case of open artefact sites, for example, the principal criteria used to assess complexity are the site’s size (i.e., number of artefacts and/or spatial extent), the presence, range and frequency of artefact and raw material types, and the presence of features such as hearths.

²⁰ There is, of course, a temporal fluidity to this criterion (i.e., as knowledge of the Aboriginal archaeology of a region increases, assessed levels of representativeness may change, a point of equal relevance to rarity).

Potential for archaeological deposit refers to the potential of a site to contain subsurface archaeological evidence which may, through controlled excavation and analysis, assist in answering questions that are of contemporary archaeological interest. Assessing subsurface potential in the absence of subsurface investigation is difficult. Nonetheless, consideration of a range of factors, including the integrity of the site, the complexity of extant surface evidence, the nature of the local geomorphology (as established through surface observations and documentary research) and the results of previous archaeological excavations in the area, will help inform assessment of this criterion.

Connectedness concerns the relationship between archaeological sites within a given area and may be expressed through a combination of factors such as site location, type and contents. It may, for example, be possible to establish a connection between a stone quarry and hatchet found nearby. Demonstrating connectedness archaeologically, however, is far from straightforward, especially when dealing with surface evidence alone. Ultimately, this difficulty rests with the need to demonstrate contemporaneity between sites that may have been created hundreds, if not thousands, of years apart. As Shiner (2008: 13) has observed, “much of the surface archaeological record documents the accumulation of materials from multiple behavioural episodes occurring over long periods of discontinuous time”. Contemporaneity, then, needs to be demonstrated not assumed. Given the nature of the archaeology within the study area and its nature and condition, demonstrating connectedness was not possible for this assessment.

8.2.3 Identification Process for Current Assessment

For the current assessment, information on the scientific values of the study area has been obtained through a review of existing environmental and archaeological data for the study area, as detailed in Sections 4.0 and archaeological survey across the study area described in Section 7.2.

8.2.4 Assessment of Scientific Significance

An assessment of the scientific significance of all sites within the study area is presented in Table 23 below and shown on Figure 23. The significance rating of “scientific significance” is offered on the basis of the assessed research potential, rarity, representativeness, PAD, complexity and integrity and assigned low (L), moderate (M) and high (H) values. In some instances, significance values have been reassessed from those assigned as part of the AECOM 2012/2015 assessments due to additional sites being identified within the study area and new information being available regarding the archaeological values of the region.

Table 23 Scientific significance assessment

Site	Type	Rarity	Representativeness	Integrity	Complexity	PAD	Research potential	Overall Significance
37-2-1954	Quarry	H	H	M	M	M	M	High

8.3 Social (Cultural) Value

Social or cultural value refers to the spiritual, traditional, historic and contemporary associations and attachments a place or area has for Aboriginal people and can only be identified through consultation with Aboriginal people (OEH 2011: 8). A summary of key cultural values identified by RAPs participating in the assessment is provided below with greater detail provided in the CVR (Appendix A).

8.3.1 Cultural Landscape

RAPs indicated that the study area sits within a broader cultural landscape that has cultural significance for Aboriginal people. Forming part of this cultural landscape are important landscape features, such as, Mount Arthur, the Hunter River, and Saddlers Creek which surround the study area, as well as the Aboriginal objects (i.e., stone artefacts) identified during the archaeological survey for the Project. Landscape features, as well as Aboriginal sites, are often associated with stories or songs and form links along songlines or pathways. More broadly, the study forms part of larger collection of Aboriginal places including Mount Yengo, Biame Cave in Milbrodale, the Lizard Rock at Laguna and Burning Mountain at Wingen.

8.3.2 Landscape Features

RAPs who participated in the AECOM (2012, 2015) as well as the current assessment highlighted Mount Arthur, located 4.5 km north of the study area, the Hunter River located south of the study area and Saddlers Creek on the northern boundary of the study area as culturally important features in the local landscape. Mount Arthur is the dominant landscape feature in the local area and has been identified by RAPs as a significant landscape feature both spiritually and as a visual landmark. One of the first references to the importance of Mount Arthur to the local Aboriginal community was from Dyall (1977) during the archaeological assessment, *Environmental Studies - Mt Arthur Project (Hunter Valley): Full Report on Aboriginal Relics* (Dyall 1977). Dyall (1977) noted that during his enquiry with local residents there were 'suggestions that Mount Arthur itself was of special significance' to the Aboriginal people (Dyall 1977: p1). Since that time, several archaeological and cultural heritage assessments have reported on the significance of Mount Arthur to Aboriginal people. Umwelt (2006) noted the significance of Mount Arthur as the dominant topographic feature of the region and additionally identifies the prominent ridgeline that radiates southeast of the mountain towards Saddlers Creek. As a visual landscape feature, Mount Arthur would have formed a landscape point (or node) within an Aboriginal pathway linking with other points or features and drawing together the broader cultural landscape. In addition, RAPs have identified Mount Arthur as the location of a potential massacre site (Section 8.3.3). The identification of an Aboriginal burial site on the Mt Arthur Mine Coal Lease in 2001 likewise forms an important contribution to the significance of Mount Arthur to local Aboriginal people.

8.3.3 Aboriginal Dispossession and Resistance

RAPs indicated that conflict, including massacres of Aboriginal people, between Aboriginal people, local settlers and Mounted Police occurred in the region surrounding the study area. In particular, Mount Arthur was noted as a massacre location. A review of oral histories recorded by Davidson & Lovell-Jones (1993) suggest a massacre of Aboriginal people by Mounted Police may have occurred immediately south of Mount Arthur in an area called "The Pocket" in the 1820s. While details varied across informants interviewed there was general consensus that a large number of Aboriginal people (c. 300) were either camping or were driven into The Pocket by Mounted Police and shot to death. However, no physical evidence has been identified related to the massacre despite detailed archaeological survey of The Pocket having been completed (Davidson, James & Fife 1993).

Further discussion on this is provided in the CVR in Appendix A.

8.3.4 Vegetation

RAPs suggested that prior to European settlement, the native vegetation communities of the study area would have contained a variety of edible and otherwise useful plant species. Cross-referencing the results of the flora surveys completed by Hunter Eco (2019) for the Project with material published on bush foods (see Cribb & Cribb 1974; Isaacs 2002; Lassak & McCarthy 2001; Stewart & Percival 1997; and Zola & Gott 1992) suggest a number of useful plant species utilised by Aboriginal people are located within the study area including Acacia, Eucalypts, Spiny-headed Matrush, Cumbungi, Grass Tree, Common Reed, Small Vanilla Lily, Headache Vine, Wombat Berry, Pale Grass-Lily, Rough-Barked Apple, Greenhood Orchids, Native Geranium, Apple-berry, Kangaroo Grass, Tussock grass, Hairy Panic Grass.

8.3.5 Mount Arthur Burial

RAPs noted that a burial site was located north of the study area at the Mt Arthur Mine. The burial was uncovered as part of salvage works completed by Kuskie and Clarke (2004) at the Mt Arthur Mine. It is understood that details surrounding the burial have not been publicised and remain restricted. However, AECOM understands that the burial was left *in-situ* but is located outside the study area and would not be impacted by the Project.

8.4 Historic Value

Historic value refers to the associations that a place has with a historically important person, event, phase or activity in an Aboriginal community (OEH 2011: 9). Historic values can but will not necessarily be represented by physical evidence.

Although situated within a broader landscape of high historical significance for contemporary Aboriginal people, the study area itself is assessed as having low historical significance. No evidence of post-contact Aboriginal occupation has been identified within the study area, neither during background historical research, archaeological field survey or consultation with RAPs. In addition, no historical records or oral histories specific to the use of the site by Aboriginal people have been identified as part of this assessment. However, it is noted that RAPs have identified that Aboriginal people are known to have been employed on farms in the greater Jerrys Plains/Edderton area.

8.5 Aesthetic Value

This refers to the sensory, scenic, architectural and creative aspects of the place. It is often closely linked with the social values. It may consider form, scale, colour, texture and material of the fabric or landscape, and the smell and sounds associated with the place and its use (Australian ICOMOS 2013).

With respect to Aboriginal heritage, key aesthetic cultural values associated with the study area include Mount Arthur, the Hunter River and Saddlers Creek, all of which are located outside the study area. While the majority of identified sites located within the study area do not have views of these features, selected sites do.

Views to and from the surrounding region would largely be unaffected by the Project due to it being largely located underground. Visual corridors between locally and regionally significant features that may form part of Aboriginal pathways or Songlines would likewise not be significantly impacted.

8.6 Statement of Significance

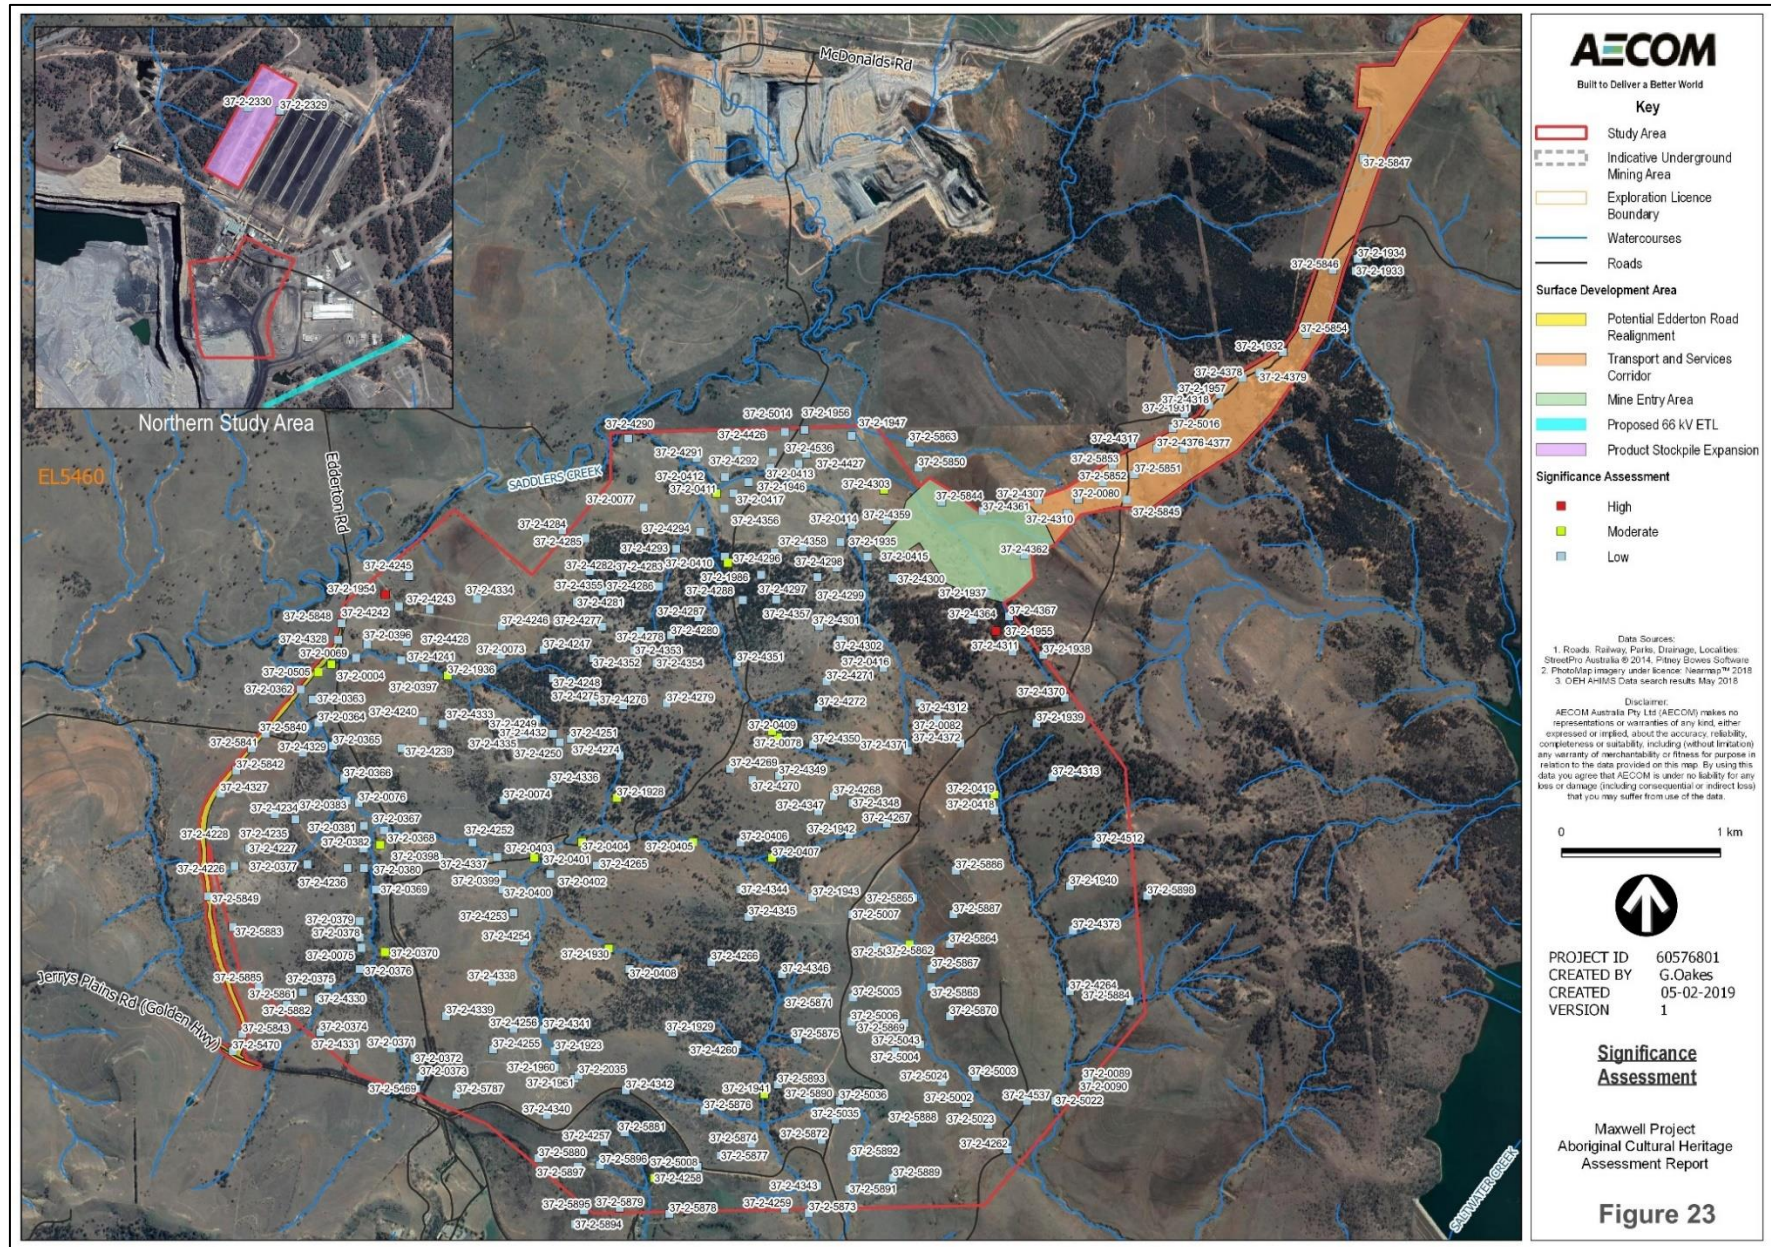

This assessment finds that the Aboriginal heritage values of the study area rest principally with the archaeological sites identified within it but also are drawn from its place within the broader cultural landscape. Identified archaeological sites within the study area attest to its past use by Aboriginal people with these sites identified by RAPs as all highly significant. The locations and densities of surface artefacts/sites across the study area are suggestive of variability in use of the landscape with an emphasis on the utilisation of land adjacent to creeklines (i.e., creek flats and lower slopes) where more abundant and diverse food and plant resources were likely available. The majority of sites within the study area have been assessed as of low scientific significance with site attributes consistent with “background scatter” and likely resulting from small-scale or limited episodes of lithic discard. Twenty sites within the study area have been assessed as of moderate scientific significance with flaked stone artefact assemblages from these locations interpreted as palimpsests²¹ of multiple, short term occupation episodes involving, amongst other activities, on-site core reduction and backed artefact manufacture or incorporating rarer or diagnostic artefact types (i.e., axes). One site within the study area was assessed as of high scientific significance due to its rarity in the region – stone quarry site 37-2-1954 - consisting of a naturally occurring outcrop of silcrete cobbles with evidence of exploitation likely the result of short term visitation events.

²¹ Palimpsests generally refer to deposits that lack clear stratigraphic relationships and or where the deposit is scrambled.

More broadly, the study area forms part of a larger and highly significant cultural landscape for Aboriginal people in the Muswellbrook region with Mount Arthur, the Hunter River and Saddlers Creek being three culturally significant landscape features in the local area. The study area was likely utilised by people travelling to and from Mount Arthur from the south and is visible from multiple locations within the study area. Likewise, both the Hunter River and Saddlers Creek were likely accessed in places from within the study area by Aboriginal people to exploit the diverse range of terrestrial, aquatic and avian resources associated with these watercourses. All three culturally significant landscape features are visible from specific sites/locations within the study area and are considered to hold aesthetic significance.

Although situated within a broader landscape of high historical significance for contemporary Aboriginal people, the study area itself is assessed as having low historical significance with no evidence of post-contact Aboriginal occupation identified within it. In addition, no historical records or oral histories specific to the use of the site by Aboriginal people have been identified as part of this assessment.

Figure 23 Significance Assessment

9.0 Impact Assessment

9.1 Summary of Proposed Impacts

As described in Section 1.2, the Project would extract coal through underground mining methods over a period of approximately 26 years. The underground mining area would be located entirely within EL 5460 (Figure 1). The Project would utilise the existing Maxwell Infrastructure plus require the development of some new infrastructure. Coal when mined would be transferred to existing coal handling, processing and train load-out facilities at the Maxwell Infrastructure prior to dispatch to markets.

The Project would include a number of key components, some of which require surface disturbance, including the mine entry area, transport and services corridor, realignment of Edderton Road, other works and ancillary infrastructure. As well as ground surface impacts from surface development, there is potential for subsidence-related impacts to sites located within the underground mining area.

9.2 Impacts to Identified Aboriginal Sites

As discussed in Section 7.4, a total of 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry have been identified within the study area.

It is noted that stone quarry sites SC-QS-1 (37-2-1955, not located) and SC-QS-2 (37-2-1954) assessed as having high significance would not be directly impacted by the Project.

9.2.1 Surface Development

Consideration of the location of sites located directly within surface development areas indicates that up to 39 open artefact sites would be wholly or partially impacted by construction of surface development associated with the Project. Table 24 presents a list of impacted sites.

Table 24 Impacted sites

Site number	Site type	Significance	Type of harm	Degree of harm	Consequence of harm
37-2-0004	Open artefact site	Moderate	Direct harm	Part	Partial loss of value
37-2-0080	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-0362	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-0505	Open artefact site	Moderate	Direct harm	Part	Partial loss of value
37-2-1931	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-1932	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-1933	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-1934	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-1937	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-1957	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-2329	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-2330	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4307	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4310	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4317	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-4318	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4328	Open artefact site	Low	Direct harm	Whole	Total loss of value

Site number	Site type	Significance	Type of harm	Degree of harm	Consequence of harm
37-2-4361	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4362	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4376	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-4377	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4378	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-4379	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5016	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-5470	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5840	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5841	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5842	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5843	Open artefact site	Low	Direct harm	Part	Partial loss of value
37-2-5844	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5845	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5846	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5847	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5848	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5849	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5851	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5852	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5854	Open artefact site	Low	Direct harm	Whole	Total loss of value
37-2-5853	Open artefact site	Low	Direct harm	Whole	Total loss of value

9.2.2 Underground Mining

Consideration of the location of Aboriginal sites located within proposed underground mining areas indicates that 238 sites, comprising 237 open artefact sites and one stone quarry, are located directly above the proposed underground mining area. Of these, two are located within areas of proposed surface development as well as being located above the proposed underground mining area and as such would be directly impacted (37-2-1937 and 37-2-0004 included in direct impact assessment above). For those sites located outside surface development areas but within proposed underground mining areas, it is noted that these sites may potentially be affected by cracking of the surface soils due to the effects of mining-induced subsidence.

The subsidence assessment completed for the Project (Mine Subsidence Engineering Consultants, 2019) suggests that based on the previous longwall mining experience in the NSW coalfields, surface cracking in the flatter areas above the proposed mining areas is expected to be typically between 25 millimetres (mm) and 50 mm, with some isolated cracking around 100 mm or greater for the Project. Surface cracking along the steep slopes is expected to be typically in the order of 50 mm to 100 mm, with isolated cracking around 200 mm or greater. Surface cracking within the boundary of an existing open artefact site (including stone quarry sites) resulting from subsidence has the potential to displace soils, including archaeological deposits, and move Aboriginal objects, both of which are considered impacts. Moreover, if remediation of the surface was required after mining, these works could potentially impact Aboriginal sites.

The subsidence assessment for the Project, completed by (Mine Subsidence Engineering Consultants, 2019) assessed the potential for subsidence impacts on Aboriginal sites. Site SC-QS-2 and the previously recorded location of the Site SC-QS-1 (not located) would not experience any measurable subsidence. Results of the assessment are provided in Appendix M.

Although considered unlikely, there is some potential for impacts to Aboriginal sites from subsidence or remediation of surface cracks. Therefore, Sections 10.0 and 11.0 present proposed management for these sites.

9.3 Impacts to Cultural Values

Three culturally significant landscape features have been identified by RAPs as relevant to the study area, including Mount Arthur, the Hunter River and Saddlers Creek. All three features are located outside the study area and would not be directly impacted by the Project. However, views of the mine entry area and portions of the transport and services corridor would be visible from both Mount Arthur and Saddlers Creek. Nonetheless, consideration of the small size of the mine entry area and the transport and services corridor, suggests these visual impacts would be minor, particularly when considering the views on offer of large open cut mines north of the study area from both Mount Arthur and Saddlers Creek. Visual impacts to the Hunter River would be fully avoided with the mine entry area and transport and services corridor not visible from any location on the Hunter River.

9.4 Cumulative Impact Assessment

9.4.1 Assessment of Ecologically Sustainable Development (ESD)

In NSW, the NPW Act provides the legislative framework for the protection of Aboriginal objects and places. Section 2A(2) of the NPW Act stipulates that such protection is to be achieved by applying the principles of Ecologically Sustainable Development (ESD). ESD requires the integration of economic and environmental considerations (including cultural heritage) in decision-making processes and, in the context of Aboriginal cultural heritage, can be achieved through the implementation of two key principles: intergenerational equity and the precautionary principle.

Intergenerational equity is the principle whereby the present generation should ensure the health, diversity and productivity of the environment for the benefit of future generations. With regard to Aboriginal heritage, intergenerational equity can be assessed in terms of cumulative impacts to Aboriginal objects and places in a region. Central to any assessment of intergenerational equity is the proposition that regions with fewer Aboriginal objects and places necessarily retain fewer opportunities for future generations of Aboriginal people to enjoy their cultural heritage. Accordingly, information regarding the known and potential Aboriginal heritage resource of a given region is critical to any assessment of intergenerational equity.

The precautionary principle holds that if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing cost-effective measures to prevent environmental degradation. In NSW, the precautionary principle is relevant to the OEH's consideration of potential impacts to Aboriginal cultural heritage in situations where:

- the proposed development involves a risk of serious or irreversible damage to Aboriginal objects or places or to the value of those objects or places; and
- there is uncertainty about the Aboriginal cultural heritage values or scientific or archaeological values, including in relation to the integrity, rarity or representativeness of the Aboriginal objects or places proposed to be impacted.

In these instances, the OEH has indicated that a precautionary approach should be taken and all cost-effective measures implemented to prevent or reduce damage to Aboriginal objects and/or places. In addition to these measures, a cumulative impact assessment should be undertaken to gain an understanding and appreciation of the impacts of development on NSW's Aboriginal cultural heritage resource.

It should be noted that the results of cumulative impact assessments undertaken for cultural heritage sites and places, Aboriginal or otherwise, must be interpreted with caution, not least because they are based (in part) on heritage datasets that are inevitably incomplete and contain various inconsistencies and errors. Godwin (2011), in particular, has questioned the value of cumulative impact assessments to cultural heritage management in Australia, arguing that the 'fundamentals' necessary for undertaking such assessments simply do not exist. The 'fundamentals' Godwin is referring to are robust regional and national datasets for measuring proposed impacts and the determination of acceptable scientific and cultural impact thresholds. While recognising the validity of the issues raised by Godwin (2011), current OEH guidelines necessitate that a cumulative impact assessment be undertaken as part of any Aboriginal cultural heritage assessment in NSW.

9.4.2 Intergenerational Equity - Cumulative Impact Assessment

Two avenues for assessing the cumulative impact of the Project on Aboriginal heritage can be pursued:

1. A comparison, using the results of AHIMS searches, of the identified Aboriginal archaeological resource of the study area with that of the surrounding region (study region), defined here as an arbitrary 20 x 20 km (400 km²) area roughly centred on the study area; and
2. The use of existing environmental data sources (e.g., digital land use data and topographic maps) to identify the potential open artefact resource of the study region as a whole.

9.4.3 Known Resource

Alongside sites identified within the study area, existing open artefact sites in the study region offer opportunities for future research, conservation and education. Accordingly, it is necessary to quantify the impacts of the proposed development on this joint resource.

As indicated in Section 9.2, 39 previously identified open artefact sites will be subject to direct impacts, either fully or partially, from proposed surface development. Impacts to identified sites as a result of mining-induced subsidence are also possible. AHIMS data obtained from the OEH on 11 May 2018 indicate that the 39 directly impacted sites represent 2.4% of the valid extant open artefact resource of the study region, with searches of the AHIMS database returning 1,594 'Valid' open artefact sites for this search region. While acknowledging the limitations of the AHIMS database with respect to the validity of listed site statuses, on the basis of these data, it seems reasonable to conclude that the loss of these sites would not constitute a significant impact to the known open artefact resource of the region. Consideration of the character of these sites, 37 of which have been assessed as being of low scientific significance and two of moderate significance, alongside a consideration that the majority of land within this region has not been physically inspected for Aboriginal sites suggests that impact of this Project is to archaeological resource of the region is not significant.

9.4.4 Potential Resource

AHIMS results only represent a fraction of the likely archaeological resource present within a region, as these results are only representative of land that has been subject to archaeological investigations. Accordingly, an assessment of the *potential* Aboriginal heritage resource of an approximate 20 x 20 km study region centred on the study area is also a useful guide. For the present analysis, land use data (dated 2017) obtained from the Land Assessment Unit at OEH was utilised (Table 25).

As a starting point, it is necessary to quantify the amount of land within the study region that has the *potential* to retain open artefact sites. A basic assumption here is that existing, grossly disturbed terrain is unlikely to retain such sites whereas non-grossly disturbed terrain does, both in surface and subsurface contexts. Analysis of available digital land use data for the study region is summarised in Table 25. This analysis indicates that grossly modified or disturbed terrain (e.g., mining and quarrying, urban and industrial areas) accounts for approximately 27.6% of land within the region. Outside of grossly disturbed areas, fully to semi-cleared grazing land is particularly well represented, accounting for approximately 63.7% of land within the region. Conservation area is likewise fairly well represented at 4.2%. Tree and shrub cover is moderately well represented at 2.7%. Cropping is poorly represented at 0.6% and horticulture land at 1%.

Table 25 Land use analysis for study region (20 x 20 km)

Existing Land Use	Km ²	%	Archaeological Potential?
Conservation Area	16.7	4.2	Yes
Cropping	2.6	0.6	Yes
Grazing	254.9	63.7	Yes
Horticulture	4	1.0	Yes
Intensive Animal Production	23.9	6.0	No
Mining & Quarrying	67.5	16.9	No
Power Generation	2.6	0.6	No
River & Drainage System	13.3	3.3	No
Transport & Other Corridors	2.8	0.7	No
Tree and Shrub Cover	10.9	2.7	Yes
Urban	0.4	0.1	No
Wetland	0.5	0.1	Yes
Total	400.1	99.9	

Source: NSW Landuse Data 2017 obtained from OEH.

Viewed from an Aboriginal archaeological perspective, the results of the land use analysis presented in Table 25 suggest that approximately 72.4% of the study region (c.289.5 km²) can reasonably be considered to comprise a *potential open artefact resource*. As indicated, land upon which open artefact deposits are unlikely to survive accounts for just over 27.6% of land within the region. This figure increases to 92% if cropping and grazing land is included. However, as indicated by the results of numerous Aboriginal archaeological investigations, both within and outside of the study region, cropped and grazed areas can and frequently do retain significant surface and subsurface stone artefact records. It can, therefore, be concluded that around 72.4% of land within the study region has the potential to retain open artefact deposits in surface and subsurface contexts. While acknowledging the fact that the nature and distribution of such deposits will vary markedly in relation to environmental variables such as landform and the availability of potable water, analysis of available land use data does help to quantify the extent of the region's potential Aboriginal open artefact resource. Moreover, it provides a basis on which to assess the cumulative impact of the proposed development on this resource.

In order to quantify the impact of the proposed development on the potential open artefact resource of the study region it is necessary to compare the amount of land directly impacted by surface development with the potential for open artefact sites within the study area (i.e., 0.52 km² = areas of high sensitivity) with that available in the search area (c.289.5 km²). On this basis, it can be stated that the Project will result in an approximate 0.18% decline in the region's potential open artefact resource. As such, it can be concluded that the impact of the Project on the potential Aboriginal archaeological resource of the region would not be significant.

With regards to the existence, outside of the study area, of environmental contexts that have the potential to contain sites comparable to those identified within it, an examination of relevant topographic maps for the study region indicates that many such contexts exist, including unmodified sections of Saddlers Creek, Saltwater Creek and other unnamed creeklines in the region. On the basis of this evidence, it can be confidently concluded that land outside of the current study area but within the wider region contains a significant, as yet unidentified, open artefact site resource.

9.4.5 The Precautionary Principle

As indicated in Section 9.4.1, the precautionary principle holds that if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing cost-effective measures to prevent environmental degradation.

In the context of the current assessment, it can be stated that AECOM has adopted a precautionary approach in our assessment of the impacts of the proposed development on the Aboriginal archaeological resource of the study area and that this approach is reflected in our proposed management strategy.

Figure 24 Impact Assessment

10.0 Avoiding and Minimising Harm

As part of its acquisition of EL 5460, Malabar committed to developing the Maxwell Project solely as an underground mining operation rather than an open cut operation which has resulted in significantly fewer environmental impacts, including impacts to Aboriginal heritage values. The Project would also use the substantial existing Maxwell Infrastructure, which would avoid the need to develop additional infrastructure required to support an underground mining operation within EL 5460.

The location of mine entry area for the Project was selected in consideration of:

- locating the mine entry area away from sensitive receptors, and in a natural valley that mitigates and minimises alteration of the visual landscape (particularly from sensitive viewsheds); and
- minimising the length of underground roadways required to access the coal seams.

Moreover, the Project mine layout was designed to avoid direct subsidence impacts on the Hunter River alluvium and Saddlers Creek, both of which are culturally significant landscape features. This has also reduced impacts to Aboriginal sites by being located mostly in areas of low archaeological sensitivity and avoiding areas with higher potential for subsurface archaeological deposit (i.e., creek flats and lower slopes).

In relation to Aboriginal heritage values, archaeological survey across the study area has identified a total of 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry, all of which were or have been registered on the OEH's AHIMS database. As indicated in Section 9.0, proposed impacts from surface development within the study area are anticipated to directly impact, wholly or partially, 39 Aboriginal sites. Of the impacted sites, 37 have been assessed as of low scientific significance and two of moderate significance. It is noted that stone quarry sites SC-QS-1 (37-2-1955, not located) and SC-QS-2 (37-2-1954) assessed as having high significance would not be directly impacted by the Project. Avoidance of impacts to all previously and newly identified Aboriginal sites within the study area from surface development is not feasible given the respective locations of these sites in relation to the proposed development. However, potential impacts have reduced through critical placement of surface infrastructure.

Significant impacts to Aboriginal sites from underground mining activities are not expected likely, with soil cracking as a result of subsidence expected to be typically between 25 mm and 50 mm across much of the study area where Aboriginal sites are present. Based on experience at similar operations less than 0.02 % of the surface area above the underground will be affected by surface cracking (Mine Subsidence Engineering Consultants, 2019).

Three culturally significant landscape features have been identified by RAPs as relevant to the study area, including Mount Arthur, the Hunter River and Saddlers Creek. All three features are located outside the study area and would not be directly impacted by the Project. However, views of the mine entry area and portions of the transport and services corridor would be visible from both Mount Arthur and Saddlers Creek. Nonetheless, consideration of the small size of the mine entry area and the transport and services corridor, suggests these visual impacts would be minor, particularly when considering the views on offer of large open cut mines north of the study area from both Mount Arthur and Saddlers Creek. Visual impacts to the Hunter River would be fully avoided with the mine entry area and transport and services corridor not visible from any location on the Hunter River.

Areas of high subsurface archaeological sensitivity within the study area were identified in association with watercourses, flats and lower slopes. These areas were assessed, on the basis of the results of the archaeological survey, field observations, RAP field comments and existing local and regional archaeological data, as retaining a high potential for the presence of subsurface archaeological deposit(s). However, as noted above and in Section 7.6 the proposed placement of surface development has avoided bulk of these areas and is predominately located in areas assessed of as low archaeological sensitivity.

In view of the above, management strategies to minimise harm to the identified heritage values of the study area are required. These strategies, which include a recommendation for an archaeological salvage program for all directly impacted sites, are detailed in Section 11.0.

11.0 Management Recommendations

The following management recommendations are made regarding the identified Aboriginal heritage values of the study area, with recommendations made on the basis of:

- a review of previous archaeological investigations completed within and surrounding the study area;
- the results of the archaeological investigation described in Section 7.0;
- the significance and impact assessments detailed in Sections 8.0 and 9.0; and
- consultation with Registered Aboriginal Parties (RAPs).

11.1 Statutory Requirements

As indicated in Section 1.0, this Aboriginal archaeology and cultural heritage impact assessment forms part of an EIS, which is being prepared to support a Development Application for the Project in accordance with Part 4 of the EP&A Act.

This ACHAR documents the results of AECOM's assessment and has been compiled with reference to the NSW Office of Environment and Heritage's *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010a), *Code of Practice for Archaeological Investigation of Aboriginal Objects in New South Wales* (DECCW 2010b) and *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011).

11.2 Management Strategy

This assessment has identified Aboriginal heritage constraints across the study area including 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry. The impact assessment undertaken in Section 9.0 has identified that up to 39 open artefact sites would be directly impacted by the proposed surface development and additional sites may be impacted by the effects of mine-related subsidence.

Archaeological test excavation was not considered warranted for the assessment of sites directly impacted by the Project as robust significance assessments and associated management strategies were deemed possible on surface evidence alone. Moreover, the majority of land to be impacted directly by surface development has been assessed as having low subsurface sensitivity.

A management strategy to address the impacts of the Project on the known and potential Aboriginal archaeological resource of the study area is provided below. It is recommended that this strategy be included in an Aboriginal Cultural Heritage Management Plan (ACHMP) for the Project, prepared in consultation with RAPs, and to the satisfaction of the OEH and the DP&E. Subject to the grant of a Development Consent under Part 4 of the EP&A Act, this ACHMP will guide the management of the known and potential Aboriginal archaeological resource of the Project area, as well as identified cultural values.

11.2.1 Archaeological Salvage Program

An archaeological salvage program for all sites impacted by surface development should be undertaken for the Project prior to the commencement of any ground disturbance within the study area and following approval of the Development Consent. The salvage program should be undertaken progressively, in line with the progression of surface disturbance. The salvage program should incorporate the following components:

- Surface collection of all aboriginal objects/sites impacted by surface development. Surface collection is considered an appropriate and effective mitigation option for these sites given their content and level of scientific significance. Section 11.3 provides a list of sites to be surface collected.

A program of open area salvage excavation as detailed in Appendix N should be undertaken for sites 37-2-0004 and 37-2-0505 (these sites lie within 100m of each and essentially comprise a single archaeological site) representing the only sites assessed of moderate scientific significance directly impacted by proposed surface development. The overarching objectives of the salvage program would be as follows:

- to salvage a representative and statistically viable subsurface assemblage of stone artefacts from 37-2-0004/37-2-0505 prior to impacts;
- to undertake post-excavation analyses that will produce and conserve knowledge of past Aboriginal occupation of the area; and
- to investigate the broader archaeological and cultural context of the study through comparative analyses of the results of the current salvage program with those conducted in the greater Upper Hunter region.

All archaeological salvage works should be undertaken by a qualified archaeologist and RAP field representatives. Post-salvage work for the excavation component of the archaeological salvage program should, at minimum, include:

- the analysis and cataloguing of all recovered Aboriginal objects (e.g., stone artefacts, hearth stones) by a suitably qualified person or persons;
- the submission, where deemed appropriate by a qualified archaeologist and/or geomorphologist, of excavated charcoal samples for conventional or Accelerator Mass Spectrometry (AMS) radiocarbon dating;
- the submission, where deemed appropriate by a qualified geomorphologist, of excavated sediment samples for OSL dating;
- the submission, where deemed appropriate by a qualified archaeologist, of a selection of stone artefacts for functional use-wear/residue analysis; and
- the submission, where deemed appropriate by a qualified archaeologist, of a selection of non-artefactual rock samples to a qualified geologist for the purposes of raw material identification.

All Aboriginal objects salvaged as part of the excavation program should be curated in an appropriate manner, as determined through consultation with RAPs, the OEH and the DP&E during preparation of the ACHMP. Temporary off-site storage of salvaged objects should be allowed for the purposes of analysis and recording.

Aboriginal Site Impact Recording (ASIR) forms for all salvaged sites should be submitted to the OEH at the completion of the salvage program.

11.2.2 Conservation of Non-impacted Sites

All Aboriginal sites not impacted by the Project but within the study area should be conserved *in-situ*. All relevant staff and contractors are to be made aware of the nature and locations of all sites as well as Malabar's legal obligations with respect to them. Protected sites will need to be identified on all relevant site plans. Details for the care of protected sites should be incorporated into the ACHMP.

11.2.3 Subsidence Monitoring

Subsidence monitoring would be conducted during mining and for a specified period post-mining, with a digital record of the nature, location and extent of all subsidence-related surface impacts within the study area recorded. Where subsidence-related impacts such as surface cracking are identified within the boundary of an existing site of moderate (or high) scientific significance, or where remediation works are required to address subsidence impacts, the site would warrant an inspection by a qualified archaeologist to determine the nature and extent of impacts, and whether mitigation is required. Mitigation measures may include further monitoring, surface collection or open area salvage excavation.

11.2.4 Aboriginal Cultural Heritage Awareness Training

An Aboriginal cultural heritage awareness training package should be developed for use throughout the life of the Project, as part of either the induction or ground disturbance permit process.

11.2.5 Previously Unrecorded Aboriginal Archaeological Evidence

Provisions regarding the appropriate management action(s) for previously unrecorded Aboriginal archaeological evidence identified within the study area throughout the operational life of the Project should be incorporated into the ACHMP. Management action(s) will vary according to the type of evidence identified its significance (both scientific and cultural) and the nature of potential impacts.

The unanticipated finds protocol should include the following steps if an Aboriginal object is identified or harmed:

1. Immediately cease all work at the particular location.
2. Secure the area to avoid further harm to the Aboriginal object.
3. Seek advice from a qualified archaeologist on appropriate management considering the nature, type and significance of the object.
4. Should it be determined the object is Aboriginal, it should be registered on the OEHS's AHIMS database as soon as practicable.
5. The following management should apply for previously unrecorded objects identified within the study area:
 - a. **Open artefact sites** (i.e., isolated artefacts and artefact scatters) assessed of low significance subject to Project related direct surface impacts (i.e., excluding subsidence related impacts) should be subject to surface collection. Sites assessed of moderate significance should be subject to surface collection and other forms of mitigation (i.e., detailed recording, test or open area excavation), regardless of impact type (i.e., including direct surface and subsidence related). Management of sites assessed of high significance would be determined through consultation with Malabar and RAPs;
 - b. **Scarred trees** identified within the study area subject to project related impacts would be managed through discussions between a qualified archaeologist, Malabar and RAPs and may include removal and relocation;
 - c. **Grinding grooves** identified within the study area subject to project related impacts would be managed through discussions between a qualified archaeologist, Malabar and RAPs and may include removal and relocation;
 - d. **Other sites** (i.e., stone quarries, ochre quarries, stone arrangements, engravings) identified within the study area subject to project related impacts would be managed through discussions between a qualified archaeologist, Malabar and RAPs.
6. A record of the find and management completed should be included in annual reporting.
7. If the site is within the surface development area (i.e., would be impacted), an ASIR form would be completed and submitted to OEHS, prior to disturbance.

11.2.6 Management of Potential Human Remains

In the event that potential human skeletal remains are identified at any point during the life of the development, the following standard procedure (New South Wales Police Force 2015; NSW Health 2013) should be followed.

1. all work in the vicinity of the remains should cease immediately;
2. the location should be cordoned off - work can continue outside of this area as long as there is no risk of interference to the remains or the assessment of the remains;
3. where it is reasonably obvious from the remains that they are human, the Project Manager (or a delegate) should inform the NSW Police by telephone (prior to seeking advice from a forensic specialist);
4. where uncertainty over the origin (i.e., human or non-human) of the remains exists, a physical or forensic anthropologist should be commissioned to inspect the exposed remains in situ and make a determination of origin, ancestry (Aboriginal or non-Aboriginal) and antiquity (pre-contact, historic or modern);

5. if the remains are identified as modern and human, notify NSW Police;
6. if the remains are identified as pre-contact or historic Aboriginal, notify the OEH using their Environment Line (131 555); and
7. if the remains are identified as historic (non-Aboriginal), notify the NSW Heritage Division.

An Aboriginal community representative must be present where it is reasonably suspected burials or human remains may be encountered. If human remains are unexpectedly encountered and they are thought to be Aboriginal, the Aboriginal community must be notified immediately.

Recording of Aboriginal ancestral remains must be undertaken by, or be conducted under the direct supervision of, a specialist physical anthropologist or other suitably qualified person.

Archaeological reporting of Aboriginal ancestral remains must be undertaken by, or reviewed by, a specialist physical anthropologist or other suitably qualified person, with the intent of using respectful and appropriate language and treating the ancestral remains as the remains of Aboriginal people rather than as scientific specimens.

11.2.7 AHIMS Site Cards

AHIMS site cards have been completed and submitted to the OEH for all newly recorded sites within the study area.

In the event that a previously unidentified Aboriginal site is discovered within the study area at any point during the operational life of the Project, an AHIMS site card for that site should be submitted to the OEH as promptly as possible. Timing protocols for the submission of AHIMS site cards should be included in the ACHMP for the Project.

11.2.8 Aboriginal Site Database

A comprehensive Aboriginal Site Database for the study area and its immediate environs should be established upon commencement of the Project. Malabar would be responsible for the creation and maintenance of this database which will, at a minimum, contain the name, type, size (where applicable), MGA coordinates and status of all Aboriginal sites within and directly adjacent to the study area. The database should be regularly updated throughout the operational life of Maxwell Project. Printed site lists and maps should be made available to RAPs upon request.

11.3 Summary of Management Mitigation Measures

Table 26 presents a summary of management mitigation measures for identified Aboriginal sites within the study area.

Table 26 Summary of mitigation measures

Site	Type	Significance	Impacts	Management
37-2-1954	Quarry	High	Not measurable	Monitoring. If impacted, salvage excavation
37-2-1955	Quarry	High	Not measurable	Not relocated
37-2-0004	Artefact scatter + PAD	Moderate	Direct	Surface collection & salvage excavation
37-2-0069	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0073	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0074	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0075	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0076	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0077	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0078	Artefact scatter + PAD	Moderate	Potential subsidence	Monitoring. If impacted surface collection and potential salvage excavation
37-2-0080	Artefact scatter	Low	Direct	Surface collection
37-2-0082	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0089	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0090	Artefact scatter	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0362	Artefact scatter + PAD	Low	Direct	Surface collection
37-2-0363	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0364	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0365	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0366	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0367	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0368	Artefact scatter + PAD	Moderate	Potential subsidence	Monitoring. If impacted surface collection and potential salvage excavation
37-2-0369	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required
37-2-0370	Artefact scatter + PAD	Moderate	Potential subsidence	Monitoring. If impacted surface collection and potential salvage excavation

Site	Type	Significance	Impacts	Management
37-2-0371	Artefact scatter + PAD	Low	Potential subsidence	Surface collection if soil remediation required

1.0 Introduction & Background

1.1 Introduction

AECOM Australia Pty Ltd (AECOM) was commissioned by Malabar Coal Limited (Malabar) to complete an Aboriginal cultural heritage assessment for the Maxwell Project (the Project), a proposed underground coal mine, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area (LGA) of Muswellbrook, New South Wales (NSW). This Cultural Values Report (CVR) is an appendix to the Aboriginal Cultural Heritage Assessment Report (ACHAR) prepared for the project. These documents will form part of the Environmental Impact Statement (EIS) which will support a Development Application for the Project in accordance with Part 4 of the *Environmental Planning and Assessment Act 1979* (EP&A Act).

This CVR documents the results of AECOM's consultation with Registered Aboriginal Parties (RAPs) as well as a background historical research. It has been prepared in accordance with the NSW Office of Environment and Heritage's (OEH's) *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (Department of Environment, Climate Change and Water [DECCW] 2010) and *Guide to Investigating, Assessing and Reporting on Aboriginal Cultural Heritage in NSW* (OEH 2011a), with reference to *The Burra Charter: Australian ICOMOS Charter for Places of Cultural Significance* (the Burra Charter) (Australia International Council on Monuments and Sites [ICOMOS] 2013) and in accordance with the first Secretary's Environmental Assessment Requirements (SEARs) issued on 3 September 2018, supplementary SEARs on 20 November 2018 and revised SEARs issued on 17 January 2019 for the Project.

1.2 Project Overview

The Project would involve an underground mining operation that would produce high-quality coals over a period of approximately 26 years.

Underground mining is proposed within Exploration Licence (EL) 5460, which was acquired by Malabar in February 2018. Malabar also acquired existing infrastructure within Coal Lease (CL) 229, Mining Lease (ML) 1531 and CL 395, known as the "Maxwell Infrastructure" (Figure 1). The Project would include the use of the substantial existing Maxwell Infrastructure, along with the development of some new infrastructure.

At least 75% of coal produced by the Project would be capable of being used in the making of steel (coking coals). The balance would be export thermal coals suitable for the new generation High Efficiency, Low Emissions power generators.

The Project would involve extraction of run-of-mine (ROM) coal, from four seams within the Wittingham Coal Measures using the following underground mining methods:

- underground bord and pillar mining with partial pillar extraction in the Whynot Seam; and
- underground longwall extraction in the Woodlands Hill Seam, Arrowfield Seam and Bowfield Seam.

The majority of surface infrastructure required for the Project is in place, having supported mining operations for over 30 years. The existing Maxwell Infrastructure would be used for handling, processing and transportation of coal for the life of the Project. The Maxwell Infrastructure includes an existing coal handling and preparation plant (CHPP), train load-out facilities and other infrastructure and services (including water management infrastructure, administration buildings, workshops and services).

A mine entry area would be developed for the Project in a natural valley in the north of EL 5460 to support underground mining and coal handling activities and provide for personnel and materials access.

ROM coal brought to the surface at the mine entry area would be transported to the Maxwell Infrastructure area. Early ROM coal would be transported via internal roads during the construction and commissioning of a covered overland conveyor system. Subsequently, ROM coal would be transported via the covered overland conveyor system.

The Project would support continued rehabilitation of previously mined areas and overburden emplacement areas within CL 229, ML 1531 and CL 395. The volume of the East Void would be reduced through the emplacement of reject material generated by the Project's coal processing activities and would be capped and rehabilitated at the completion of mining.

A detailed description of the Project will be provided in the main document of the EIS.

The Project would include a number of key components, some of which require surface disturbance, including:

1. Mine entry area to access the underground mining areas – approximately 48 hectares (ha).
2. Transport and services corridor – approximately 104 ha outside of the existing mining disturbance.
3. Potential for re-alignment of Edderton Road – approximately 10 ha.
4. Product stockpile expansion – approximately 5 ha.
5. Other works and ancillary infrastructure.
6. Subsidence zone – area within the underground mining area and surrounds.

Mine Entry Area

The mine entry area would include infrastructure, services and facilities that would support underground mining and coal handling activities and provide for personnel and materials access to the underground mine. The mine entry area would also include ventilation infrastructure.

Transport and Services Corridor

The transport and services corridor would include:

- a site access road from the Maxwell Infrastructure; and
- a covered, overland coal conveyor system to transport ROM coal from the mine entry area to the existing CHPP at the Maxwell Infrastructure.

The transportation of early ROM coal from the mine entry area to the existing CHPP would also occur via the internal roads within the transport and services corridor.

Edderton Road Realignment

Potential subsidence impacts on Edderton Road would be managed through either road maintenance along the existing alignment or realignment of the road around the underground mining area. This ACHAR conservatively assesses the potential impacts associated with realigning Edderton Road. The potential Edderton Road realignment would intersect the Golden Highway approximately 1 kilometre (km) to the west of the current intersection.

Product Stockpile Expansion

It is proposed to increase the capacity of the existing product stockpiles. An additional product stockpile would be constructed to the east of the existing product stockpiles, with a total area of 5 ha (some of which is previously approved disturbance).

Other Works and Ancillary Infrastructure

Other works and ancillary infrastructure would occur outside of the defined surface development areas throughout the life of the Project. These works would include, but not be limited to, environmental and subsidence monitoring activities, remediation of subsidence impacts, exploration, development of service boreholes, site maintenance activities and other minor ancillary works. These surface disturbances would be temporary and isolated in nature. The surface disturbances would occur progressively and these areas would be rehabilitated when no longer required.

1.3 Study Area

The study area for this assessment includes three spatially discrete parcels of land encompassing the proposed underground mining area, inclusive of a potential impact zone buffer, as well as land required for surface infrastructure (i.e., transport and services corridor, Edderton Road realignment, product stockpile extension, etc.) (Figure 2). Combined, these areas produce a study area of c. 2,330 ha that extends south of the existing Maxwell Infrastructure as a thin transport and services corridor, expanding to a roughly circular area south of Saddlers Creek and north of the Hunter River. The majority of land within the study area has historically been used for grazing. Components of the Project that will occur on previously mined land have been excluded from the study area for this assessment.

1.4 Report Objectives

The overarching objectives of this CVR are as follows:

- to identify the Aboriginal cultural values of the study area by way of background research, archaeological survey and consultation with Registered Aboriginal Parties (RAPs); and
- to compile a CVR that will assist the Secretary of the Department of Planning and Environment (DP&E) in their assessment of the current State Significant Development (SSD) application.

1.5 Project Team

Geordie Oakes (Principal Heritage Specialist, AECOM) and Dr Andrew McLaren (Senior Heritage Specialist, AECOM) were the primary authors of this report.

Geordie holds a Bachelor of Arts (Honours) degree majoring in history, and historical/prehistoric Archaeology from Sydney University and also a Graduate Certificate in Paleo-anthropology from the University of New England. Geordie has over ten years of Australian Aboriginal cultural heritage management experience.

Andrew holds a Bachelor of Arts (Honours) degree from the University of Queensland, a Master of Cultural Heritage from Deakin University, and a PhD from the University of Cambridge in England and has over 10 years of Australian Aboriginal cultural heritage management experience.

1.6 Limitations

It is noted the registered Native Title claimant *Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People* (PCWP) did not wish to participate in consultation for this report or the broader ACHAR. In addition, AECOM understands that a confidential submission potentially containing cultural information relevant to the current study area was made to the Planning Assessment Commission regarding the Drayton South Coal Project. The PCWP has indicated that this report will not be made available for the current assessment.

Access to the Mount Arthur burial report is restricted and as such is not available for comment in this CVR.

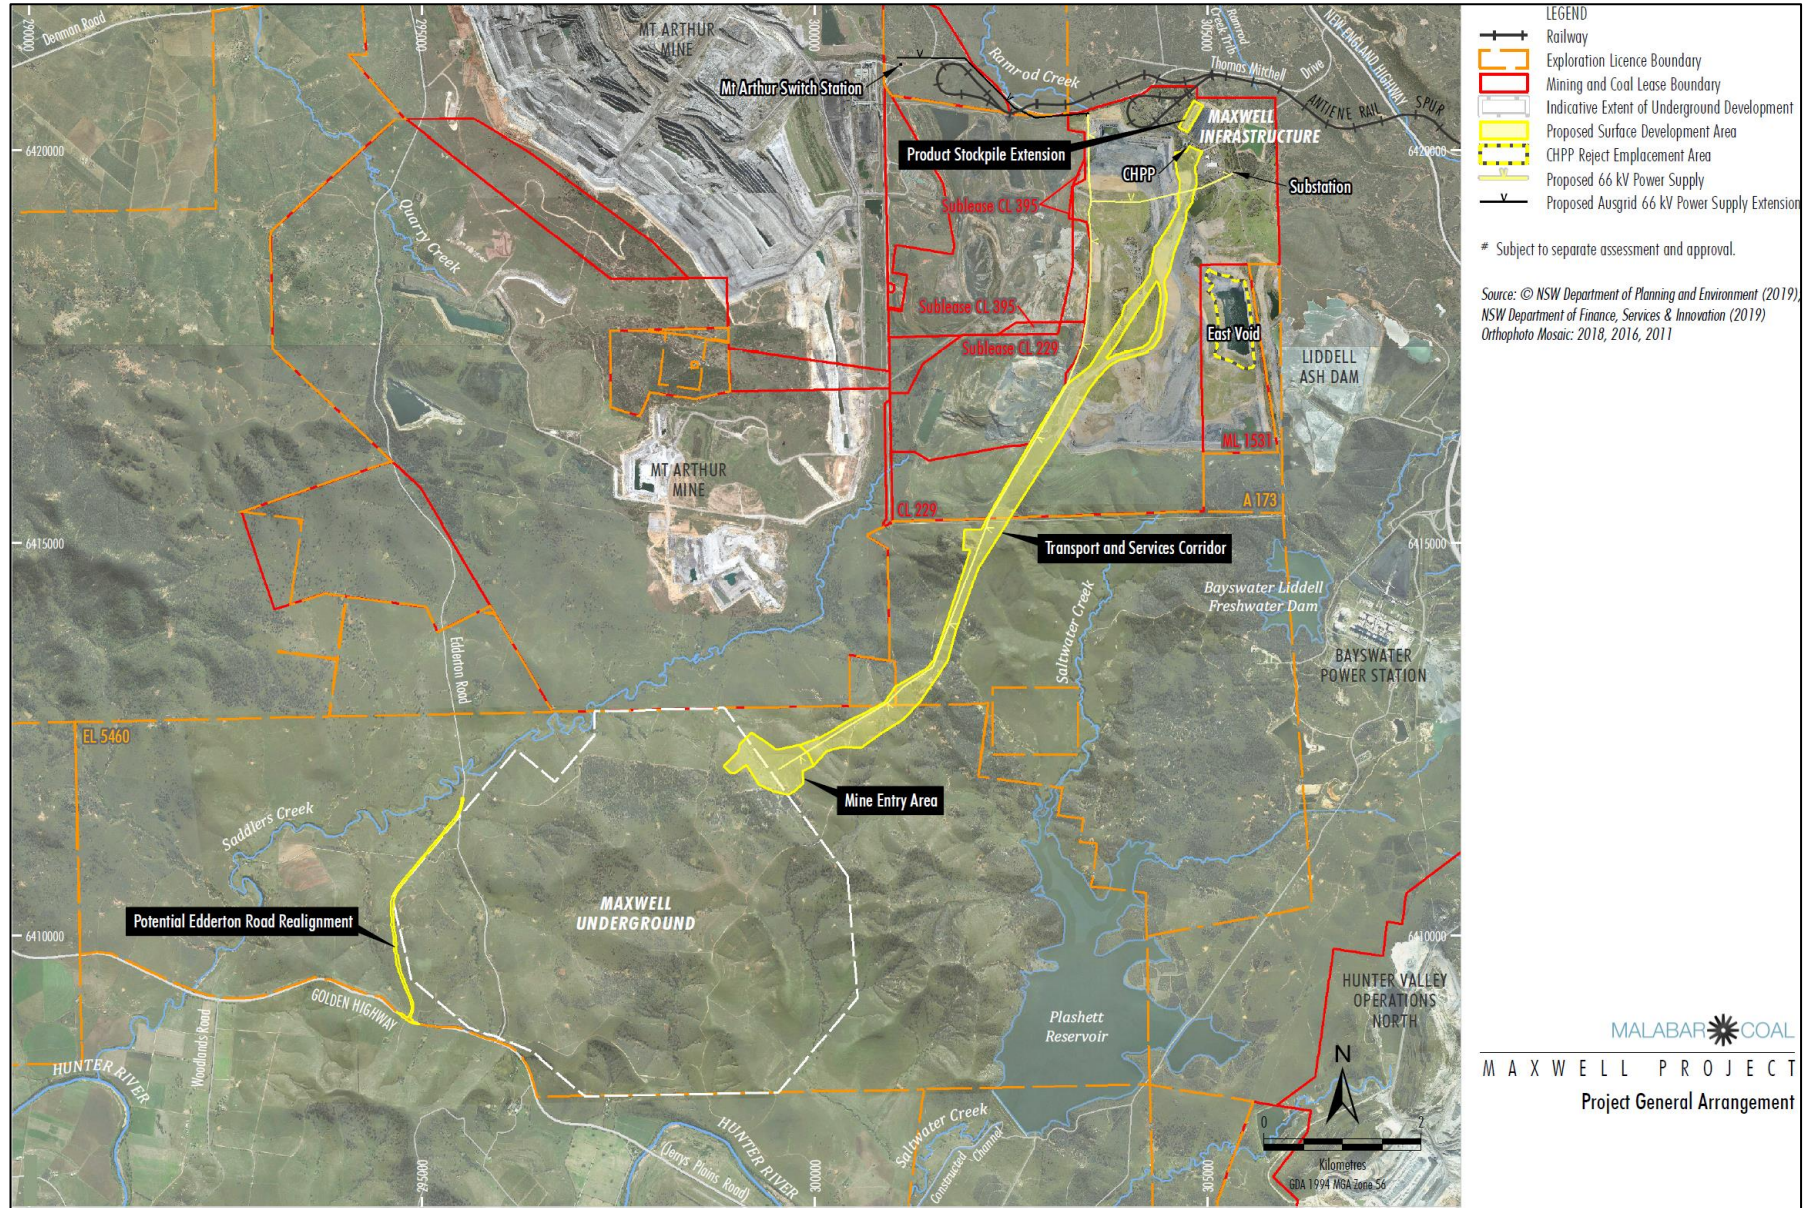

Figure 2 Study Area

2.0 Methodology

This CVR was prepared utilising information provided by RAPs in addition to undertaking background historical research to provide context for identified cultural values. Key tasks completed for the ACHAR, which has informed this CVR, (this assessment) include:

- Consultation with RAPs to identify cultural values;
- Survey of the study area with RAPs;
- Review of archaeological literature for the Upper Hunter Valley;
- Review of ethno-historical literature for the Hunter Valley;
- Searches of relevant historic heritage registers and lists; and
- Background research including reviews of relevant reports, publications, historic aerials and parish maps including:
 - State Library of NSW/Mitchell Library;
 - Trove newspaper archives and the Spatial Information Exchange (SIX) maps; and
 - State archives of NSW.

2.1 What are Aboriginal Cultural Values?

Aboriginal cultural values comprise of any place or object of significance to Aboriginal people resulting from their traditions, observances, lore, customs, beliefs and history. These values, which may comprise physical (tangible) or non-physical (intangible) elements are evidence of the lives and existence of Aboriginal people prior to European settlement through to the present. They include objects used by Aboriginal people such as stone tools, art sites and ceremonial or burial grounds as well as more contemporary elements such as old mission buildings, massacre sites and cemeteries which all form part of a broader cultural landscape (OEH 2011a).

Aboriginal cultural values also relate to the connection and sense of belonging that Aboriginal people have with the landscape and each other. These values are not only confined to sites but also include memories, storylines, ceremonies, language, 'ways of doing things', passing on knowledge and looking after cultural traditions and places (OEH 2011a).

Aboriginal cultural values provide a tangible link between the past and present - it is an essential part of Aboriginal people's cultural identity, connection and sense of belonging to Country (OEH 2011a).

2.2 What is Cultural Significance

Assessing the cultural significance of a place or object requires defining the reason why a place is culturally important. This process can be difficult and emotive. However, it is only after understanding which places are culturally significant and why, can decisions be made about managing them. Once all the reasons for a place's importance are set out, it is possible to assess any changes that may be caused by a proposed activity. This helps ensure any changes do not damage, diminish or remove the reasons for a place's importance (OEH 2011a).

In Australia, the primary guide to the assessment of cultural significance is *The Burra Charter: Australian ICOMOS Charter for Places of Cultural Significance* (2013), informally known as the Burra Charter, which defines cultural significance as the "aesthetic, historic, scientific, social or spiritual value for past, present or future generations" of a site or place (ICOMOS 2013: 2). Under the Burra Charter model, the cultural significance of a heritage site or place is assessed in terms of its aesthetic, historic, scientific and social values, none of which are mutually exclusive (Table 1). Establishing cultural significance under the Burra Charter model involves assessing all information relevant to an understanding of the site and its fabric (i.e., its *physical* make-up). The assessment of cultural significance and the preparation of a statement of cultural significance are critical prerequisites to making decisions about the management of any heritage site or place (ICOMOS 2013: 2).

Table 1 Values relevant to determining cultural significance, as defined by The Burra Charter (ICOMOS 2013)

Value	Definition
Aesthetic	“Aesthetic value includes aspects of sensory perception for which criteria can and should be stated. Such criteria may include consideration of the form, scale, colour, texture and material of the fabric; the smells and sounds associated with the place and its use” (ICOMOS 2013).
Historic	“Historic value encompasses the history of aesthetics, science and society...[a] place may have historic value because it has influenced, or has been influenced by, an historic figure, event, phase or activity. It may have historic value as the site of an important event” (ICOMOS 2013).
Scientific	“The scientific or research value of a place will depend on the importance of the data involved, on its rarity, quality or representativeness, and on the degree to which the place may contribute further substantial information” (ICOMOS 2013).
Social	“Social value embraces the qualities for which a place has become a focus of spiritual, political, national or other cultural sentiment to a majority or minority group” (ICOMOS 2013).

2.3 Aboriginal Cultural Landscape

The following is taken from DECCW’s Fact Sheet 2 – What is an Aboriginal cultural landscape? (DECCW 2010). An Aboriginal cultural landscape is ‘a place or area valued by an Aboriginal group (or groups) as a result of their long and complex relationship with that land. It can embody their traditional knowledge of spirits, places, land uses, and ecology. Material remains of the association may be prominent, but will often be minimal or absent’ (Buggey 1999).

The landscape scale of cultural heritage is similar to the concept of ‘whole-of-landscape’ in ecosystem conservation – just as there is connectivity between all parts of natural ecosystems (e.g. plants, animals, soils and water) there is connectivity between cultural objects and places through past human behaviour patterns. The cultural landscape concept emphasises the landscape-scale of history and the connectivity between people, places and heritage items. It recognises that the present landscape is the product of long-term and complex relationships between people and the environment. Aboriginal cultural landscapes are comprised of:

1. Significant biodiversity and a diverse range of ecological systems and associations, all of which contributed to the continuing existence of Aboriginal peoples in the region over many thousands of years, and which are valued in different ways by Aboriginal communities today.
2. Material remains of this continuing occupation in the form of a diverse array of Aboriginal sites and places known to the Aboriginal communities, some of which will be recorded on the OEH Aboriginal Heritage Information Management System (AHIMS).
3. Extensive historical records from 1788 through to today which record observations of Aboriginal people and lifestyles, wars, massacres, social and cultural events, population census, social interactions, language, etc., and which influence Aboriginal community values today.
4. An Aboriginal population made up of people who have traditional association and knowledge of the region, as well as others who live, work and play within the region, all of whom may attribute various values with the area, derived from the distant and recent past, through to the present day.

For Aboriginal people, the significance of individual landscape features is derived from their interrelatedness within the cultural landscape. This means features cannot be assessed in isolation and any assessment must consider the feature and its associations in a holistic manner. This may require a range of assessment methods and will always require the close involvement and participation of Aboriginal people (DECCW 2010).

2.4 Consultation Process

Aboriginal community consultation for the current assessment was undertaken in accordance with OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW 2010) (Consultation Requirements), clause 80C of the NSW *National Parks and Wildlife Regulation 2009* and *Engage Early* (Australian Government Department of the Environment 2016). Further detail on the consultation completed for the project is provided in Section 3.0 of the ACHAR.

2.4.1 Stage 1 - Notification and Registration

Stage 1 included identifying (through consultation with regulatory agencies), notifying and registering of Aboriginal people who may hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects and/or places in the study area.

A total of 27 Aboriginal organisations registered an interest in the Project. Summary information on all RAPs, including registration dates, is provided in Table 2.

2.4.2 Stage 2 - Presentation of Information about Project

Malabar and AECOM completed initial consultation regarding the Project through the registration process with invitations to register containing key project information including a map of the study area. More detailed information, including a summary of study area environment, a review of relevant archaeological literature and AHIMS data, was provided to all RAPs as part of the draft assessment methodology.

Also contained within the methodology was an invitation for all RAPs to attend an ACHAR information session at the Maxwell Infrastructure site offices. The session was held on Friday 10 August 2018 with representatives from six RAPs attending including Hunter Valley Aboriginal Corporation, Cacatua, AGA Services, Culturally Aware, Wallagan Cultural Services and Ungooroo Aboriginal Corporation. The presentation included information about the Project, the study area, previous archaeological works completed, proposed disturbances, proposed avoidance of harm measures. The process of identifying cultural values was also discussed and invitations extended for RAPs to provide cultural values as part of the information session or via private meetings. Following the meeting, the draft methodology was finalised.

2.4.3 Stage 3 – Gathering Information about Cultural Values

For the assessment consultation with RAPs regarding the cultural heritage values of the study area included:

- A request with the draft assessment methodology for any initial comments regarding the Aboriginal cultural heritage values of the study area;
- A request during the information session held on Friday 10 August 2018 for any information regarding the Aboriginal cultural heritage values of the study area;
- Discussion of cultural heritage values during fieldwork;
- Offers made to RAPs for private interviews, in case the information is considered culturally sensitive;
- Provision of the draft ACHAR to all RAPs for comment prior to finalisation; and
- Invitation to all RAPs to attend an ACHAR discussion session following the provision of the draft ACHAR.

3.0 Identified Cultural Values

RAPs participating in the assessment identified the following cultural values as relevant to the study area:

- The cultural landscape;
- Aboriginal dispossession and resistance:
- The Mount Arthur Burial;
- Archaeology in the study area;
- Raw material sources and quarry sites; and
- Plant resources.

These cultural values have been organised into themes for discussion below with further information provided for each.

3.1 Cultural Landscape

As discussed in Section 2.3, an Aboriginal cultural landscape is 'a place or area valued by an Aboriginal group (or groups) as a result of their long and complex relationship with that land. It can embody their traditional knowledge of spirits, places, land uses, and ecology. Material remains of the association may be prominent, but also may be absent. The World Heritage Convention of United Nations Educational, Scientific and Cultural Organization (UNESCO) suggest that a cultural landscape is one that combines works of nature and those of humankind and express a long and intimate relationship between people and their natural environment.

Aboriginal people have occupied the Hunter Valley region for thousands of years and have a strong connection to the local landscape. They will have moved across the Hunter Valley landscape utilising local landmarks as guides and in doing so creating an interconnecting network of pathways that link the natural environment with resource areas, camping grounds and ceremonial sites together. This connection, created prior to European encroachment, has been maintained and built on since that time.

Aboriginal pathways across the Hunter Valley landscape will have followed ridgelines, creeklines and other landscape features criss-crossing the landscape into places where neighbouring groups met up to trade, for social gatherings or to act out traditional ceremonies. Pathways used by Aboriginal people in the area may retain evidence of use in the form of scarred trees, middens, artefact sites, burials and rock art sites. The relationship between these sites, places and landscape features, including their views are integral elements in the cultural landscape. Elevated landscape positions or vantage points can provide line of sight between features which in themselves have cultural significance.

Previously identified pathways within the Hunter Valley as noted in OEH's *Pathways Across the Hunter a Cultural Journey* (OEH 2011b:15) includes a pathway from Muswellbrook travelling through the Goulburn River Valley to Nullo Mountain providing access over the Great Dividing Range and linking the Muswellbrook region to the Cudgegong River and the Liverpool Plains (Wiradjuri Country). Offering a permanent water source, the Goulburn River Valley would have been an ideal pathway, with archaeological evidence suggesting it was commonly utilised (OEH 2011b:15).

Alongside the Goulburn River Valley and Nullo Mountain, other areas of identified significance include Murrumbo Gap, Mt Dangar, Apple Tree Aboriginal area, Cassilis, Merriwa and Dunns Swamp (OEH 2011b:16). From Dunns Swamp, pathways likely went across the Wollombi and down to the Putty Road through Howes Valley to Bucketty. Growee Gulf to the Goulburn River has also been highlighted as a potential pathway with easy access and to a permanent water source. Other important sites and features found across the Hunter Valley that would have formed nodes linking pathways together include Mount Yengo, Biame Cave in Milbrodale, the Lizard Rock at Laguna and Burning Mountain at Wingen (OEH 2011b:16).

Biame Cave at Milbrodale shows an artistic representation depicting Biame the 'Creator' with outstretched arms. The site has been listed on the State Heritage Register (SHR) where the listing explains that Biame Cave is linked to the Creation story, country and totem (the Eagle) of the Wonnarua people, and is interconnected with numerous other Aboriginal cultural and heritage sites and landscapes throughout the Hunter Valley and NSW (SHR 2019).

Mount Yengo located in Yengo National Park west of Wollombi is likewise listed on the SHR. Mount Yengo is an important spiritual and ceremonial site for local Aboriginal people. It is the place where from which Biame jumped back up to the spirit world after he had created all of the mountains, lakes, rivers and caves in the area. Biame flattened the top of Mount Yengo when he jumped skyward and the flat top is still visible today (SHR 2019).

Lizard Rock at Laguna is said to be the birthplace of a giant lizard with a yellow rock considered to be the Lizard's head with its body being the ridgeline and an arch on the rock said to be the lizards eye. The lizard or goanna is said to protect Wonnarua Country, occupying a lookout between Broke and Milbrodale (OEH 2011b:18).

The story of Burning Mountain and the southern rock face in nearby Wingen Main Nature Reserve describes how a raiding party from the Kamilaroi north of the Liverpool Ranges attempted to steal Wonnarua women for wives. However, friends of the Wonnarua, the Wiradjuri to the west told them of the raid so they gathered their warriors and sent them to battle the raiding party. One of the warrior's wives sat on the top of a finger of sandstone waiting for her husband to return but he had been killed in the battle. She cried and her tears become flames that set the whole hill on fire. She asked Biame to take her life so Biame turned her to stone. As she turned to stone, she cried tears of fire, which rolled down the hillside and set Burning Mountain alight. It is said she can still be seen today, sitting and waiting on the southern rock face (OEH 2011b:19).

RAPs indicated that the study area sits within the broader cultural landscape described above and that it has cultural significance for Aboriginal people. Forming part of this cultural landscape locally are important landscape features including Mount Arthur, the Hunter River, and Saddlers Creek which surround the study area, as well as the Aboriginal objects (i.e., stone artefacts) identified during the archaeological survey for the Project. The presence of Aboriginal objects demonstrates that Aboriginal people camped within the study area but also undoubtedly moved through it as they traversed the region into the surrounding regions. One RAP stated:

The cultural landscape is of high importance to the Aboriginal people, it's a part of our cultural connection especially a majority of this Landscape as it tells a cultural story to us, and shows how all the sensitive cultural landscape surrounding this area all merge together to be part of a bigger picture

Mount Arthur is the dominant landscape feature in the local area and has been identified by RAPs as a significant landscape feature both spiritually and as a visual landmark. One of the first references to the importance of Mount Arthur to the local Aboriginal community was from Dyal (1977) during an archaeological assessment of the Mt Arthur Project. Dyal (1977) noted that during an enquiry with local residents there were 'suggestions that Mount Arthur itself was of special significance to the Aboriginal people'. Since that time, several archaeological and cultural heritage assessments have reported on the significance of Mount Arthur to Aboriginal people. Umwelt (2006) noted the significance of Mount Arthur as the dominant topographic feature of the region and additionally identifies the prominent ridgeline that radiates southeast of the mountain towards Saddlers Creek. As a visual landscape feature, Mount Arthur would have formed a landscape point (or node) within an Aboriginal pathway linking with other points or features and drawing together the broader cultural landscape. In addition, RAPs have identified Mount Arthur as the location of a potential massacre site (see discussion below). The identification of an Aboriginal burial site on the Mount Arthur Coal Lease in 2001 likewise forms an important contribution to the significance of Mount Arthur to local Aboriginal people.

The Hunter River or *Coquun*, as it was called by some Aboriginal people (Albrecht 2000), formed an important resource for Aboriginal people in the past. Moreover, it was likely an important landscape feature that may have been utilised as a boundary marker but also a link between Aboriginal people in the region. As highlighted and discussed at length by Geary and Erskine (1984) the post-European settlement history of the Hunter River has been one of dynamic change, with significant channel changes and river bank erosion occurring since at least 1857. The Hunter River has been noted previously as an Aboriginal pathway linking the Muswellbrook and Singleton regions (Australian Cultural Heritage Management 2014; OEH 2011b).

Saddlers Creek is also a noted a focal point for past Aboriginal activity. As suggested by RAPs, the cultural significance of Saddlers Creek lies in its importance as a source of aquatic resources to past Aboriginal people living in the area. Saddlers Creek is likely to have been a significant source of water and also a major food resource for Aboriginal people travelling to and through the area.

3.2 Aboriginal Dispossession and Resistance in the Mid to Upper Hunter Valley

Concerted Aboriginal resistance to European colonisation of the mid-to-upper Hunter Valley commenced in the mid-1820s, with the opening of the valley for free settlement in 1822 prompting a land rush that fairly rapidly placed the region's resident Aboriginal population and European colonisers at loggerheads with each other. Initially, at least, the relationship between the two parties appears to have been one of relative peace, with few reported incidents of violence prior to 1825¹ (Dunn, 2015: 188-95; Miller, 1985: 33). As Dunn (2015: 190-91) has observed with reference to the Hunter Valley more broadly:

*Initially the establishment of European farms did not seriously impinge Aboriginal movements across the country. In the first months and in some cases years after establishment, few of the estates had fence lines or enclosed lands, with large areas of the surrounding forest remaining uncleared. Aboriginal food sources were maintained to some degree, with access to grey kangaroo, possum, bandicoot and other small mammals and reptiles still available in the forests and across the open grassland, as were the freshwater mussels from the river and its tributaries. Yams were a staple through the valley, growing in the alluvial soil close to the river, with the seeds of the *Zamia spiralis*, berries of the *Exocarpos cupressiformis* or Native Cherry also included in the diet.*

However, increasing numbers of European livestock, growing areas of cultivation and European farms along the rivers did begin to compromise traditional food sources by the mid-1820s. European hunting of kangaroos and emus with dogs for sport disrupted this food source, scattering mobs from their feeding grounds. Flocks of sheep tended by shepherds and herds of cattle let loose in the bush gradually trampled native pastures. New settlers now ensconced on their grants, worked to clear the land, erecting huts and planting orchards while their convict servants built fences, systematically locking in land parcels. Their growing sense of entitlement and ownership appears to have worked to harden their views on an Aboriginal presence in their neighbourhood. So, soon after many of these settlers had utilised the skills of Aboriginal guides and interpreters, they were putting in place measures, often threatening or violent, to exclude Aborigines from the very country they had led them through. Evidence of extreme violence and depravity committed by European settlers and their convict servants were seemingly overlooked in the quest to secure land and property.

¹ As Miller (1985) has noted, the fact that Aboriginal-European relations during the initial years of settlement appear to have been more-or-less cordial is of particular note given both the rapidity of European settlement at this time and well documented violence occurring in the adjoining Bathurst Plains region.

By late 1825, simmering tensions in the mid-to-upper Hunter, rooted in Aboriginal peoples' loss of access to traditional hunting and fishing grounds, a sharp decline in the availability of economic plant and animal resources and individual acts of physical violence against Aboriginal individuals and/or groups, boiled over into violent conflict. Regardless of the terminology used, be it a 'war' or 'uprising', available historical source materials for the mid-to-upper Hunter Valley attest to a short but intense period of Aboriginal-European conflict between late 1825 and mid-1827, with the conflict here, as in many other parts of NSW and Australia more broadly, characterised by a series of 'incidents'², each linked to a particular set of circumstances (Dunn, 2015: 189).

Dunn (2015), drawing on the results of an exhaustive review of Aboriginal-European relations in the Hunter Valley between 1820 and 1850, has identified an October 1825 incident on James Greig's farm 'Martindale', south of present-day Denman, as the 'opening act' of the short but intense period of conflict referred to above. On the 28th of October 1825, two settlers, Mr Forsyth and Mr Allen, called at James Greig's farm for breakfast only to discover what they believed to be Greig's dead body on the floor of his hut, as well as his convict servant missing, presumed dead (The Australian, 10 November 1825: 3). The deceased, as it was later confirmed, was actually Greig's cousin, Robert Greig, whom the former had charged with tending to his property and livestock while in Sydney on business. Newspaper reports at the time provided no obvious cause for Greig's killing, though local magistrates sent to investigate raised Greig's known aversion to Aboriginal people as a potential motive (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 610).

James Grieg himself, writing to this brother in Scotland the following year, said he could not tell the exact cause of the attack but noted that he had been informed by a friendly Aboriginal man that Robert had beaten another Aboriginal man, which had "irritated the tribe he belonged to" and caused his "untimely end" (Grieg 1826a). In letter to a friend, penned on the same day, Grieg explained the situation further, stating that "[a]lthough the black natives are by no means hostile, [they] are always very revengeful when injured by any white person" (Grieg 1826b). That Robert Greig's individual conduct was the motive for his murder was reinforced by Lancelot Threlkeld, who informed then Attorney General, Saxe Bannister, that he had heard that Grieg had struck the Aboriginal man and driven his party from the property (Gunson (ed), 1974: 91). Cunningham's (1827: 36-37) account of the incident identifies an Aboriginal man named Nullan-Nullan ("the beater") as the perpetrator, with Cunningham describing how Nullan-Nullan, after approaching in a friendly manner, had "glided behind" Grieg and killed him with a single blow to the back of the head. Upon killing Greig and plundering the hut, Nullan-Nullan and his party are reported to have withdrawn southward, into the mountains, with Cunningham (1827: 37) and magistrates Scott and McLeod describing this action as a retreat made in fear of European retaliation (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 610). An attack on two European shepherds in the Putty area, one of whom was killed, followed soon after, and prompted the colonial authorities to send a party of soldiers from Windsor to Putty to apprehend the individuals involved. In a clear escalation of violence, the soldiers intercepted and killed several members of what would later be determined to be a friendly Aboriginal group (Cunningham, 1827: 38-39).

² Often violent in nature

Although linked to the attack on Grieg's property by Cunningham (1827), available sources suggest that the Putty attacks were, in fact, rooted in events that occurred several years earlier. In an 1839 letter to magistrate Robert Scott, George Bowman of 'Archerfield', near Singleton, recounted how the two men attacked at Putty had played a central role in Governor Macquarie's 1816 punitive military expedition along the Hawkesbury-Nepean River, which would see at least 14 Aboriginal men, women and children massacred at Appin (the so called 'Appin massacre'). Bowman, whose reminiscences of Aboriginal-European conflict in the Hunter Valley were requested by Scott, described the situation as follows:

In 1825 a party of Natives from Richmond and another from the Hunter met at Putty on the old Hunters River road and killed one man and left the other as they supposed dead, but who was found by Mr. G. Bowman's overseer and men when driving his sheep to the Hunter, in a speechless state, his head crawling with worms in the wounds received from the Blacks.

This murder was supposed and believed to be true, from information received from other Natives, to have taken place through those two men having been instrumental in having some of the natives apprehended in 1816 or 17, when Governor Macquarie offered the reward for and outlawed by his proclamation. The Natives were not allowed to carry any warlike instruments within a certain distance of any White Man's Dwelling on pain of being dealt with according to Martial Law. The military did not attempt to take the Blacks and make prisoners of them, but shot all they fell in with and received great praise from the Government for so doing. (Bowman to Scott, 5 January 1839, Indigenous Peoples File: Correspondence on Black Natives, Upper Hunter 1826, Singleton District Historical Society)

In June 1826, colonial authorities, responding to various "acts of violence" in the 'upper districts' of the Hunter³, deployed ten soldiers, with accompanying bush constables, inland from Newcastle. Several Aboriginal men suspected of involvement in recent robberies and attacks were captured in turn. However, all managed to escape (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 611). An attack on George Forbes' Edinglassie estate around the same time saw one of the settler's Merino sheep killed, a shepherd in his employ speared through the shoulder and a hut on the property plundered⁴. In their report to the Colonial Secretary, magistrates Scott and McLeod note that an Aboriginal man, known as Billy, was subsequently apprehended for his involvement in the raid and jailed in Newcastle.

Shortly after the raid on Forbes' property, a stockman working on the Ravensworth estate of James Bowman, located around 25 km south-west of Edinglassie, was attacked and stripped naked, with the same individual killed two days later. A raid on James Chilcott's farm, located on Fal Brook, a few kilometres east of Bowman's estate, followed only days later, with Scott and McLeod reporting the involvement of the "same Natives", who "attempted by force to plunder the house" before being repelled (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 611).

To assist the troops already deployed to the region, on 24 June 1826, Governor Darling ordered a detachment of Mounted Police, commanded by Lieutenant Nathaniel Lowe of the 40th regiment, to the region (Chaves, 2007: 130). Shortly after Lowe's arrival in the valley, The Australian reported that "the natives who lately committed such havoc among the stockmen ...retreated to the other side of the mountains" (The Australian, 24 June 1826). Regardless, continued Aboriginal threats of further raids prompted the deployment of additional troops to support Lowe, with the killing of Aboriginal people commencing in July (Chaves, 2007: 130). Scott and McLeod, for their part, report the shooting of four individuals, one of whom was deemed responsible for the death of Dr Bowman's stockman. All were shot while in custody (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 611).

³ Alongside the murder of Grieg, Scott and McLeod's report to Colonial Secretary McLeay refers to "several petty robberies" on the road above James Bowman's Ravensworth estate, as well as raids on the farms of Peter McIntyre (Segenhoe) and Francis Little (Invermien), with McIntyre reportedly pursuing the raiders until forced to retreat.

⁴ Note that soon after the raid on Forbes' property, local magistrate William Ogilvie, accompanied by a "friendly" Aboriginal man, was able to track down the raiding party and negotiate the return of items taken from the settler's hut.

By August 1826, rumours of Aboriginal people being killed in “peculiar circumstances” were starting to emerge from the region, with Threlkeld, for example, informing the Attorney General that Aboriginal people at the Bahtahbah mission, along with those arriving from the mountains, were reporting indiscriminate shootings and hangings, as well as the massing of bands of warriors in the mountains for a wide-scale attack across the valley (Gunson (ed), 1974: 92). Upon hearing the rumours, and conferring with Captain Allman at Newcastle, Governor Darling ordered an investigation by local magistrates Scott and McLeod, who prepared their report for his review (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12). Despite his earlier instructions from Lord Bathurst to oppose hostile Aboriginal incursions across the Colony with force and his belief, in this particular arena, in the “criminality of the natives”, Darling made it clear that “the massacre of prisoners in cold blood” was unacceptable “as a measure of justifiable policy” (Darling to Bathurst, 6 October 1826, HRA, Vol. 12: 623). Unsatisfied with the level of information provided by Scott and McLeod, Darling would soon order a second investigation into Aboriginal-European hostilities in the Hunter, which was undertaken by Scott and another local magistrate, E.C. Close. As part of this second investigation, Lowe and others, including local settlers John Larnach of “Rosemount” and James Glennie of “Dulwich”, provided depositions in which they outlined their own versions of events. These depositions document various acts of violence against Aboriginal people, including multiple shootings, with those deposed invariably framing such incidents as justifiable responses to attempted escapes (see Dunn, 2015: 202-204).

In contrast to the ‘sanitised’ depositions of Lowe and his party, other contemporary sources paint a much darker picture of the unfolding conflict (Dunn, 2015: 204). In an August 1826 letter to Saxe Bannister, for example, Threlkeld described how, upon visiting one of the two fencers attacked on James Bowman’s property in Newcastle hospital, he was informed by the fencer that Lowe’s troops had captured and summarily executed an Aboriginal man who, while part of the group involved in the attack, was not involved in physically injuring him (Threlkeld to Bannister, 21 August 1826). Ultimately, inconsistencies in Scott and McLeod’s initial inquiry, coupled with obfuscations in Scott and Close’s second inquiry, prompted Governor Darling to order a third investigation, which saw Acting Attorney General W.H. Moore travel to Newcastle and Wallis Plains in January 1827 (Dunn, 2015: 205). As part of his inquiries, Moore sought Threlkeld’s opinion on the situation, who informed him, on the basis of information provided by his own Aboriginal informants, of three troubling incidents. These included the execution of a man, reportedly later identified as Jackey Jackey (not to be confused with the Jackey Jackey who accompanied explorer Edmund Kennedy on his expedition to Cape York Peninsula), at the gaol in Wallis Plains, the shooting of an escapee near the Hunter River and a macabre shooting / hanging on James Bowman’s Ravensworth estate (Gunson (ed), 1974: 95).

By mid-July 1826, Lowe’s actions in the valley appear to have subdued Aboriginal peoples’ resistance activities. In a letter to Lieutenant De La Condamine, penned on 18 July 1826, Captain Allman informed his superior that “no acts of violence have been committed by the Aborigines in this District from some weeks past; and, from the preserving exertions of Lieutenant Lowe and his Detachment, there is every reason to hope for permanent tranquillity” (Allman to De La Condamine, 18 July 1826, HRA, Vol. 12: 622).

Hostilities, however, soon resumed, with August 1826 witness to two major incidents, the first occurring on William Ogilvie’s Merton estate and the second on Captain Robert Lethbridge’s Bridgman estate at Fal Brook. That on Ogilvie’s property, which ended without bloodshed, saw around 200 painted and armed warriors, led by an Aboriginal man known as Jerry, approach the farm, their presence prompted by two recent on-property incidents involving the wrongful detainment of Jerry and, earlier, two boys named Tolou and Mirroul⁵ (Wood, 1972: 121-123).

⁵ Tolou and Mirroul, whose European names were Ben and Denis, had been arrested at Merton in mid-August, allegedly for the spearing of cattle. Both were transferred to Newcastle gaol on 16 August 1826.

The confrontation at Merton, which would see Mary Ogilvie and her second son, Edward, who had learnt the local language, deescalate a potentially violent situation, is described in detail in Mrs Ellen Bundock's (1932) memoir of her childhood at Merton:

Amongst my recollections of my childhood was playing with my brother Fred outside of the house when on looking up we suddenly saw the whole hill covered with Blacks all armed to the teeth except the King or Chief Jerry who was most amicable to us - a fine dignified looking man. He was clothed in an opossum skin rug and strips of fur round the loins – he kept shaking hands with each of us in turn to convince his subjects that he was on friendly terms with us. Our father was absent in Sydney just then so our Mother was alone with us children and only a few convicts about the place. The only weapon the Chief had was a Waddy stuck in his belt which was worn on all occasions by the natives. He kept going amongst the other blacks trying to quiet them and last they fled away over the hills to our inexpressible relief having only taken a little corn from a shed at hand and having shaken all of the Constable's rations on the ground.

The cause of all this trouble and of the Blacks anger was an act of treachery committed by the Constable and soldiers who were left for our protection and who were placed under our Mother's orders. These soldiers had persuaded some of the Blacks to come to Merton under pretence of seeking guides to go after the Bush rangers but when the Blacks came they seized two of them (our chief Jerry and another man) believing that this Jerry was a murderer of the same name for whom a reward was offered. Our Mother...had seen the Constable and soldiers struggling with two Blacks, one of whom escaped and the other they forced into the hut. She...insisted on seeing the Black they had shut up who proved to be Jerry our Chief and on our Mother's declaring who he was and that he was not the murderer the soldiers released him, but fearing the indignation of the Blacks at their treacherous dealing with them they deserted us, clearing away in the night and leaving us to reap the consequences of their bad conduct which might have resulted in the loss of all our lives...[T]he blacks said to the last that if they had found the constable and soldiers they would have murdered them all for their treachery.

Contemporary accounts of the incident at Merton are full of praise for Mrs Ogilvie's conduct. The Australian, for example, applauded her "great degree of resolution" (The Australian, 9 September 1826: 3), while Governor Darling reported to London that Mrs Ogilvie "had acted with much judgement and spirit" (Darling to Hay, 9 September 1826, HRA, Vol. 12: 574). Cunningham, too, referred to Mrs Ogilvie's actions as "[a] fine instance of intrepidity". While Mary and Edward Ogilvie's actions were undoubtedly brave, as Dunn (2015: 209) has observed, the crisis at Merton also highlights "the intimate nature of the frontier", with the Ogilvie family's personal friendship with Jerry and Edward's knowledge of the local language serving to defuse what could well have been a deadly confrontation.

Unlike that at Merton, the incident at Robert Lethbridge's Bridgman estate would involve significant bloodshed and precipitate what is colloquially known as the 'Ravensworth massacre'. On 28 August 1826, a group of approximately 15 Aboriginal men gathered at the hut of Richard Alcorn, overseer for Lethbridge's Bridgman estate. Alcorn's hut was situated on Fal Brook, around half a mile upstream from Dulwich, the homestead of James Glennie and around a quarter of a mile from James Chillcott's hut, which had, as noted above, been recently raided. Alcorn's wife, Charlotte, is reported to have offered the group some kangaroo to eat, which they took and roasted on a nearby fire (Deposition of John Woodbury, 29 August 1826, HRA, Vol. 12: 613-614).

The warriors also requested maize and bread but were told that there was none. A few of the assembled warriors entered the hut though none showed any signs of violence. Around 4pm, Alcorn returned to the hut and was reportedly unsettled by the presence of so many armed warriors, three of whom he recognised as being involved in the raid on Chilcott's farm. After discussing the situation with John Woodbury, a stockman of Thomas Cullen who was present at the hut, the two men ordered the group to leave. This order, according to Woodbury's testimony, sparked a fierce attack by the assembled warriors, which ultimately resulted in the wounding of Woodbury and Alcorn and the deaths of two other Europeans, Henry Cottle and Morty Kernan. After raiding adjoining workers' huts for bedding and blankets, the warriors are said to have retreated into the bush (Deposition of John Woodbury, 29 August 1826, HRA, Vol. 12: 614). Mounted troops alerted to the unfolding incident pursued the group the same day but were unable to locate them.

Robert Scott, the nearest magistrate, arrived at Alcorn's hut the following day and concluded that the warriors involved were not those involved in other incidents in the district, though Woodbury identified four by name, including three he believed to have been involved in the attack on Chilcott's farm (Deposition of John Woodbury, 29 August 1826, HRA, Vol. 12: 614; Deposition of Robert Scott, 30 August 1826, HRA Vol. 12: 615). Scott was quick to organise a posse to track down the group involved and three days later, approximately 20 miles (32 km) from Alcorn's hut, "came up with the murderers" (Scott and McLeod to McLeay, 3 October 1826, HRA, Vol. 12: 612). According to Scott and McLeod's brief account of the event, a 'skirmish' ensued, with one European speared in the face, two Aboriginal warriors killed and "some more" wounded. However, a more detailed account of the event in *The Australian*, published on 23 September 1826 and reproduced in part below, listed the number of Aboriginal dead at 18, with two others reportedly taken into custody:

Further particulars have been communicated to us of the fight with the blacks in the district of Hunter's River. It appears that as soon as it was made known that the black fellows had committed the outrage on Mr. Lethbridge's farm, three of the Mounted Police, accompanied by Mr. Scott and some prisoners, and some friendly natives, set out in quest of them. Having continued the pursuit for some time, they at length discovered their tract, and afterwards lost it, but on the following day they were fortunate enough to fall in with it again, and by the light of fires which the hostile tribes kindled towards evening, the precise spot they occupied was soon ascertained. Two men, one a white man, and the other a black, were sent forward to reconnoitre their position, &c. and as they came suddenly upon them they were descried by the party of blacks, who immediately set up the cry "Kill white man." Upon this the two being each provided with a musket (the blacks are good shots, we are informed) fired among them, and then retired behind trees to reload. At this moment a spear was hurled which struck the native black on one side of the face, pierced his cheek, and protruded through the opposite cheek, having passed curiously enough through a hollow in the mouth, occasioned by the loss of a tooth! The remainder of the pursuers hearing the firing, hastened to the spot, and as the whole of them, mounting probably to about sixteen, were furnished with muskets — they discharged these among the sable enemy. A hot conflict followed, the natives maintaining their ground, and making the most dexterous use of their spears. At last they were obliged to yield, betake themselves to flight, leaving behind them about eighteen of their comrades who were numbered with the dead. A man and his gin were taken prisoners. The attacking party sustained no loss of lives. (The Australian, 23 September 1826)

As with most incidents of conflict in the mid-to-upper Hunter, the exact location of the Ravensworth massacre site remains unclear. Gollan (1993), for her part, has argued that the Mount Arthur area is the most likely place for the massacre to have taken place. According to Gollan, this area was the only portion of the upper Hunter that had not been taken up by European settlers by this time and likely functioned as a ‘bastion’ for post-contact Aboriginal occupation (Figure 3). A contemporary reference⁶ to the Aboriginal warriors involved in the attack retreating to the “mountains” is likewise deemed indicative by Gollan, as is the Mount Arthur area’s ‘strategic’ location with respect to launching the kinds of attacks witnessed up to that point (Figures 4 and 5). Contra Gollan’s interpretation, Umwelt’s (2004) analysis of the incident, undertaken as part of an Aboriginal heritage assessment for the Glendell Open Cut, casts doubt on the suggestion that the massacre took place to the west of Alcorn’s hut (i.e., “up” valley, towards Mount Arthur). As Umwelt (2004) explain, contemporary accounts of the incident imply:

...that the Aboriginal people that took part in the attack came from the mountains and were returning to the mountains when the reprisal attack (massacre) took place. The account by Scott and MacLeod (HRA XII 1826: 612) also suggests that at least one woman was included in the Aboriginal group attacked. If the Aboriginal attackers had travelled 20 miles (approximately 32 kilometres) in the direction of the mountains (or even into the mountains) they could have travelled in a northerly or easterly or (less likely) southerly direction from Bridgman Farm. There are no mountains in a westerly direction (and no significant range to the south). A westerly direction would have taken the fleeing Aborigines and their pursuers up the valley rather than into the mountains. If the Aboriginal people that attacked the hut at Bridgman Farm travelled towards the mountains they would have travelled away from the area now proposed for the Glendell Open Cut. Thus, the massacre site is highly unlikely to be located within the Glendell ML or within the Ravensworth Estate. Even if the Aboriginal people had travelled in an easterly direction they would have passed through the area of the present Glendell ML and the Ravensworth Estate by the time they had travelled 7 miles, rather than the 20 miles they were reported as travelling prior to the pursuing party catching up with them.

In common with Umwelt (2004), other, more recent considerations of the massacre (e.g., ACHM, 2013; Dunn, 2015) have placed it outside of Bowman’s Ravensworth estate. Dunn (2015), whose exhaustive review of Aboriginal-European hostilities in the Hunter Valley remains one of the most detailed studies of its kind for the region, has mapped it as occurring in mountainous terrain to the northwest of Alcorn’s hut (Figure 6). ACHM, meanwhile, have prepared a map which shows an approximate area where the massacre cannot have occurred (ACHM, 2013: 69, Map4-1). While this map allows for the possibility that the massacre could have occurred within the Mount Arthur area, on the basis of available evidence, this seems unlikely.

Figure 5 Gollan's (1993) map of Aboriginal 'attacks' leading to the Ravensworth massacre (from Gollan, 1993: Map 3)

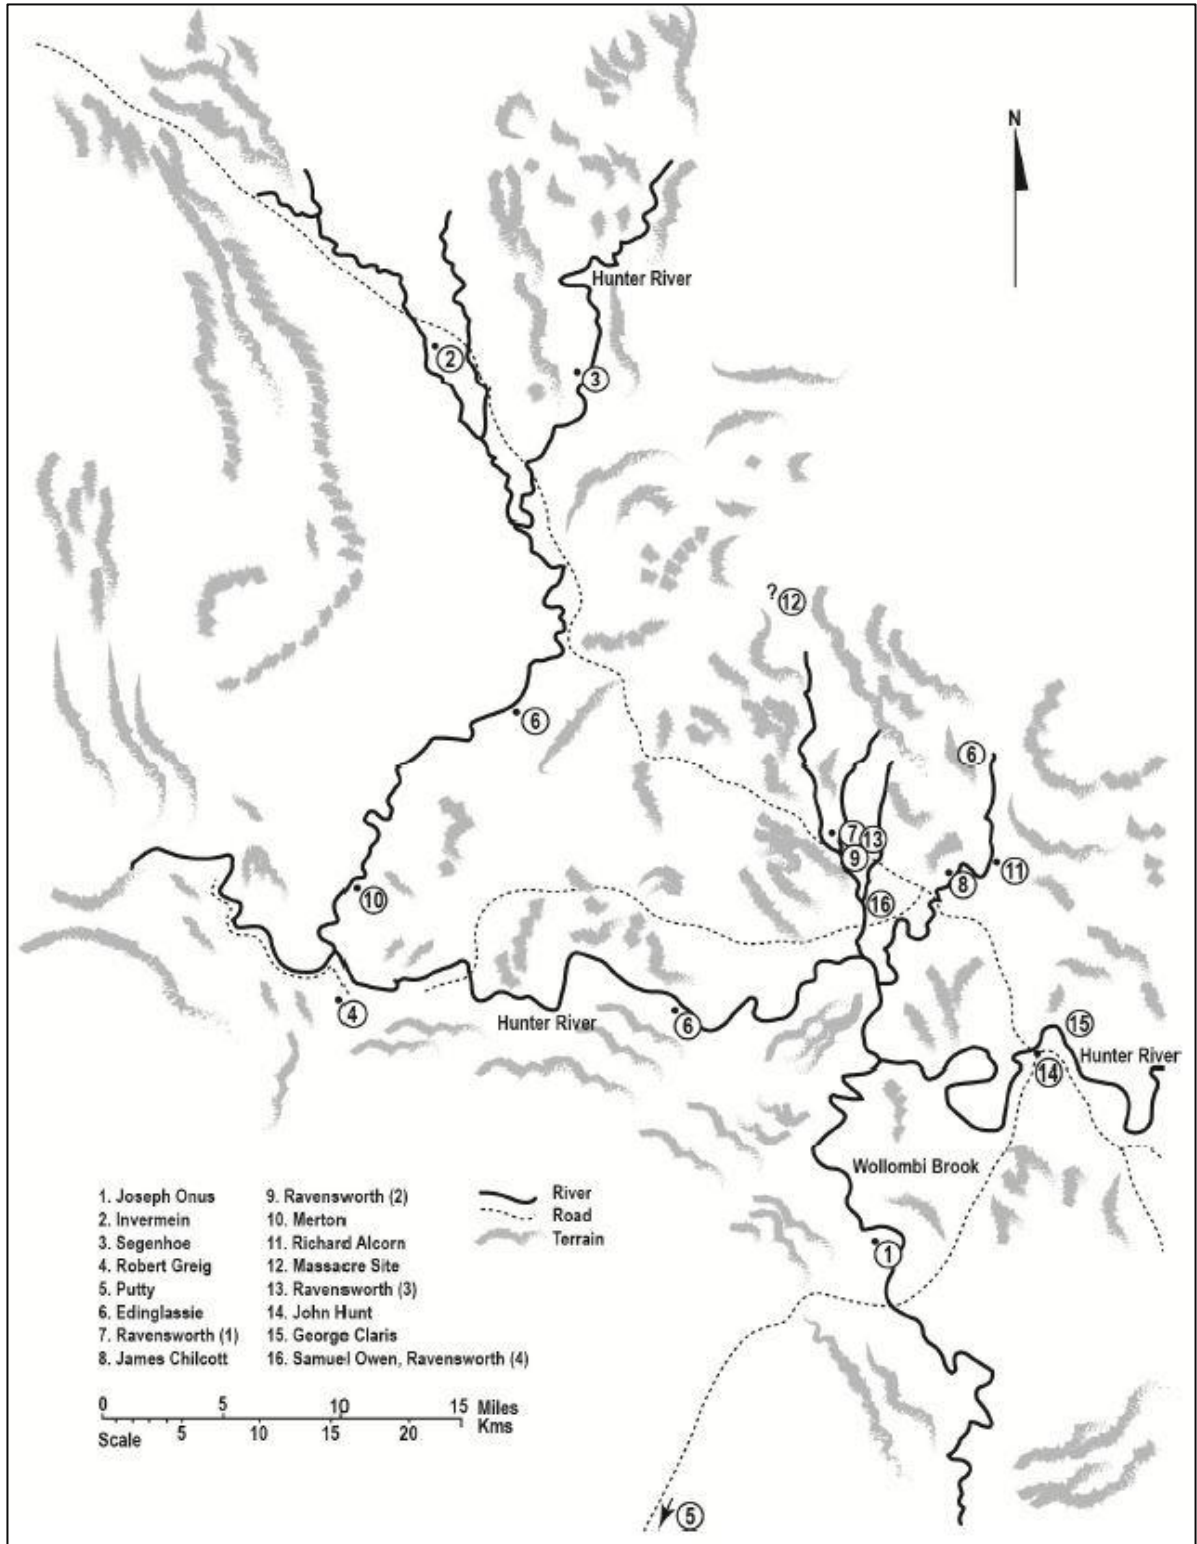

Figure 6 Map showing the location of reported incidents of Aboriginal-European conflict in the Hunter Valley between 1825 and 1827, including the ‘Ravensworth massacre’ (from Dunn, 2015: 228, Fig. 16).

By September 1826, tensions in the mid-to-upper Hunter had reached fever pitch, with various contemporary observers, such as Threlkeld and Robert Scott's brother, Helenus Scott, talking of war (see Gunson, 1974: 93; Helenus Scott to Augusta Scott, 25 September 1826, Scott Family Correspondence, ML). Fears of Aboriginal attacks amongst the settler population were such that on the 4th of September 1826 a group of concerned landholders, including James Bowman, Peter McIntyre and William Ogilvie, petitioned Governor Darling to maintain the Mounted Police's presence in the district:

May it Please Your Excellency,

We, the undersigned, Landholders at Hunter's River's river, beg leave most respectfully to represent to Your Excellency the present very disturbed state of the Country by the incursions of numerous Tribes of Black Natives, armed and threatening death to our Servants, and destruction to our property.

We are fully impressed with the intentions of Your Excellency by ordering the protection of the Horse Patrole; at this moment; we have received information that some of the Soldiers are withdrawn to attend an Investigation at Newcastle on a subject connected with the marauding conduct of the Natives.

We most humbly trust Your Excellency will take this into Your consideration, either by ordering others to take their places, or by suspending the order of their recall to Newcastle, until the threats and murderous designs of the Natives shall have subsided; for, in the event of our losing the protection of the Troops, our property will be exposed to the revenge and depredation of these infuriated and savage people.

The Natives lately burnt all the grass on the several Farms, killed some Men, have speared several Cattle, and threatened to destroy the Wheat of the ensuing Harvest.

We have, &c.,

J.Bowman J.H. Winder.

Peter McIntyre David Maziere

A.B. Spark William Ogilvie

Leslie Duguid, H. Malcom

J. Gaggin. John Brown

John Cobb

(Landholders to Governor Darling, 4 September 1826, HRA, Vol. 12: 576)

As highlighted by Dunn (2015: 217), this petition had arisen from Governor Darling's decision to withdraw Lowe and his troops from the district and his ordering of the second inquiry into the actions of the Mounted Police under Lowe's command. The landholders involved were unlikely to have been impressed with Darling's response, with the Governor urging the settlers themselves to unite and adopt "vigorous measures" to establish their "ascendency" over the district's Aboriginal population (Darling to Landholders at Hunter's River, 5 September 1826, HRA, Vol. 12: 576-577). In a closing rebuke, the Governor felt it necessary to point to out the fact that not one of the petitioners, all of whom were based in Sydney, were physically present in the district to witness any of the outrages they were reporting. As hinted at by the signatories themselves, whose petition contains the word 'revenge', the closing sentences of Darling's response, reproduced below, point not to indiscriminate violence on the behalf's of the district's Aboriginal population but rather to retaliatory strikes:

As you very properly attach much importance to the preservation of your property, I would remark that your presence and personal example would tend to this object than any measure of the Government. It would have the effect of preventing irregularities on the part of your own people, which I apprehend is in many instances the cause of the disorders committed by the Natives.
(Darling to Landholders at Hunter's River, 5 September 1826, HRA, Vol. 12: 577)

Attorney General Saxe Bannister, for his part, urged Governor Darling to deploy the military to the district, claiming that those “interested upon Hunter’s River” would be best served by a show of “overwhelming force” (Bannister to Darling, 5 September 1826, HRA, Vol. 12: 577). Bannister suggested the declaration of martial law, as had occurred in Bathurst in 1824, proposing that this would not only reinforce the government’s determination to resolve the matter but also provide legal protection for any soldiers sent to the district. Darling would subsequently dismiss Bannister’s call for martial law, informing the Attorney General that the size of the district’s settler population was such that the threat posed by the ‘natives’ was a minor one.

The war feared by Threlkeld and others was not to eventuate. Nonetheless, hostilities continued throughout the remainder of 1826 and first half of 1827, with notable incidents from this period including the November 1826 abduction of the 20 month old daughter of John and Catherine Hunt⁷, an act attributed to an Aboriginal man known to Europeans as ‘Bit-O-Bread’ (Byirbyrry), and a bloodless March 1827 confrontation at George Claris’ hut on John Howe’s Redbourneberry estate, near Singleton, the primary motivation for which appears to have Byirbyrry’s anger at being accused of the kidnap of Hunt’s daughter. “King” Jerry, who was present with Byirbyrry at Claris’ hut, is said to have warned Claris that any harm to Byirbyrry would result in him amassing 1000 warriors to kill any European they encountered. Outside of the Hunter Valley, the first half of 1827 would also bear witness to the Supreme Court trial of Lieutenant Lowe for the August 1826 murder of Jackey Jackey at Maitland Gaol, with Lowe, perhaps predictably, acquitted of the crime (for a detailed review of Lowe’s trial see Chaves, 2007).

The accounts of Dunn (2015) and others (e.g., Miller, 1985; Wood, 1972) point to a significant reduction in the scale of Aboriginal-European conflict in the mid-to-upper Hunter from mid-1827. Attacks and confrontations continued to occur. However, the high point of conflict had passed, with the majority of ‘prime’ land within the region now firmly in European hands⁸. Despite this stranglehold, Aboriginal ‘returns’ from 1827 onward attest to the continued presence of relatively large numbers of Aboriginal people in the region. Data of relevance to the mid-to-upper Hunter is summarised in Table 3 below, with examples of returns for the Patrick’s Plains, Merton, and Wallis Plains districts, provided in Figures 8 to 13. As indicated in Table 3, despite several years of European occupation, ‘early’ (i.e., 1827-1829) returns for the mid-to-upper Hunter indicate a total Aboriginal population well into the hundreds.

Returns for the mid-to-upper Hunter also provide insight into the social and territorial organisation of the Aboriginal groups occupying this region around the time of European colonisation. While acknowledging the well-documented problems surrounding early European observers’ use of the word ‘tribe’, with many tribal names, for example, comprising European inventions, a number of existing returns for the mid-to-upper Hunter contain the names of individual ‘tribes’, with places or districts of ‘usual resort’ sometimes also specified. For the mid-to-upper Hunter, a review of returns prepared for districts⁹ and estates within this region (e.g., Patrick’s Plains, Wallis Plains, Segenhoe, Invermein and Merton) reveals marked differences in the amount of information available regarding group names and associations. Returns for the Merton district, for example, contain almost no useful information¹⁰, with only one return, prepared in July 1844, containing an Aboriginal group name, the ‘Gnarnical’ or ‘Gnarnoical’, which is likely an alternative spelling of ‘Gundical’. The Gundical, according to Edward Ogilvie, son of magistrate William Ogilvie, were one of the four ‘tribes’ that made up the Gummun Kamilaroi of the Upper Hunter - Goulburn River valleys, with the remaining three groups consisting of the “warlike” Marawancal, the Toolomm-pikilal and the “fine Intelligent” Panin-pikilal (Wood, 1972: 137).

⁷ John Hunt served as a district constable at Patrick’s Plains

⁸ Note that Miller (1985: 42) has suggested that, post-1830, the majority of Aboriginal resistance to European colonisation of the Hunter Valley was passive, as opposed to armed, in nature.

⁹ Note that the physical extent of historically-documented districts or localities within the mid-to-upper Hunter (e.g., Patrick’s Plains, Wallis Plains, Merton) remains poorly defined, with the project area arguably located at the eastern extremity of the Merton district.

¹⁰ As William Ogilvie himself remarked in his April 1827 return: “[T]he Black Natives are very numerous here, but I am not able to distinguish their tribes, nor do I think they are distinctly separated into tribes but assemble in larger or smaller parties according to the object they have in their view – certainly they have no distinct chiefs...”(Ogilvie to McLeay, 22 April 1827, SRNSW 4/2045)

In general, returns for the Patrick's Plains district are the most informative for the region, with James Glennie's August 1829 return (Figures 10 to 12), for example, identifying four distinct 'tribes' within this district; namely, 'The Plains Tribe', 'The Bulcara Tribe', 'The Micarrawillung Tribe' and the 'Kinkigyne or Hungary Hill Tribe'. Glennie's return also contains the European and Aboriginal names of all of the men in each group, including their respective 'kings'. Places of usual resort for the groups listed are not specified. However, it is noted that a June 1834 return for the district (Figure 13) places the 'Kinkigyne or Hungary Hill Tribe' at Fal Brook. Moving further up the valley, Francis Little's June 1828 return lists two 'tribes' within the district under his jurisdiction: the 'Tullong Tribe' and the 'Murawin Tribe', with Little placing the Tullong in the Dartbrook area and the Muarwin along the Paterson and Pages Rivers (Figures 15 and 16). Peter McIntyre's December 1829 return for Segenhoe, in contrast, contains no useful information with respect to group names and localities.

Table 3 Aboriginal returns for districts and estates in the mid-to-upper Hunter valley between 1827 and 1844 (data compiled from originals / facsimiles held at the State Archives of New South Wales, [4/2045], Reel 3706)

Figure 14 Francis Little's June 1828 return for the district surrounding his Invermien estate in Dartbrook Page 1 of 2 (SRNSW, 4/2045)

28th / 48th / - 21st June 1828. Invermien Hunter River
 June 5th - 1828 -

Sir I received your Circular letter of the 29th of April, requesting that a return be made to you of the number of Black natives in this District, a few days ago, and have endeavoured to make as correct a list as possible. There are two Tribes or Families who inhabit this District - The Tullong and Murrāwin. The former Chief resides in the neighbourhood of Dart Brook - The latter on Pages River.

The Tullong Tribe consists of
 19 Men
 11 Women
 9 Children
Total 39

The Murrāwin Tribe consists of
 16 Men
 8 Women
 5 Children
Total 29

Figure 15 Francis Little's June 1828 return for the district surrounding his Invermien estate in Dartbrook Page 2 of 2 (SRNSW, 4/2045)

There is besides these two
 Tribes or Family a very strong
 Tribe which we sometimes
 see belonging to Lowerpool
 Plains upon the occasion
 I saw about 50 men with
 a number of women and
 children I should think
 about 30 or 40 Blankets
 would be enough to give
 and a few Tomahawks
 would be of great value to
 them I have the honor to be
 Sir
 Your most obedient
 &
 very humble servant
 Francis Little

The Hon^{ble}
 Alex McLeay Esquire
 Colonial Secretary
 & & &

3.2.1 Mount Arthur Massacre

Specific to the study area, a review of documentary sources for the mid-to-upper Hunter has not identified any reported incidents of Aboriginal-European conflict within or immediately surrounding this area. As indicated above, Gollan (1993) has suggested that the incident known colloquially as the 'Ravenworth massacre' is likely to have occurred within the Mount Arthur area, north-west of the study area. However, other, more recent reviews of this incident (e.g., Dunn, 2015; Umwelt, 2004) cast doubt over this interpretation.

Historically documented incidents of conflict notwithstanding, RAPs involved in the current assessment have identified Mount Arthur, located approximately .5 km north of the study area, as the location of a massacre. While no details of this incident were provided to AECOM as part of the current assessment, it is likely that the incident to which the RAPs are referring is the same incident reported by Aboriginal informants involved in Davidson and Lovell-Jones' (1993) ethnographic investigation for the then proposed Bayswater No. 3 Colliery. Davidson and Lovell-Jones (1993: 20) report several of their informants as having told them of a massacre within 'The Pocket', a prominent re-entrant to the west of Mount Arthur proper (Figure 16). As described in their report:

Several people told the same story, with few contradictions (related below), in the course of this study. This story relates to The Pocket or The Little Pocket on the southern side of Mount Arthur. It is believed by these people that a group of approximately 300 local Aboriginal people were either camping in, or were driven into, The Pocket by the Mounted Police (numbers of police unknown). The story goes on to relate that the Aboriginal people, who were thought to be the last survivors in the district, were subsequently all shot to death, men, women and children, by the mounted police from 'on top of the pocket'. No one could then relate what they may have been told had happened to the bodies.

All but one of the informants believed the massacre at The Pocket to be accurate, as, all informants trusted that the person who told them was a reliable and honest source (usually a parent or grandparent). They also related their fears of the area and spoke of 'horses always being spooked near The Pocket', they would also 'get this feeling that someone was watching me' and their own 'hair rising on the back of the neck' and of nearby 'windmill spinning tail first' with or without accompanying wind. (Davidson and Lovell-Jones 1993: 20)

These observations aside, Davidson and Lovell-Jones (1993: 20) noted a lack of corroborating material evidence for the massacre reported by their informants:

None the informants who worked around Mount Arthur or played in the rock shelters or 'caves' of Mount Arthur, as children, ever saw any human remains or other material culture remains of Aboriginal people. One informant indicated that in one 'cave', in Mount Arthur, there is a crack along the back where 'if you throw a rock down it you can't hear it land'. The archaeological survey in The Pocket revealed three locations with artefacts, but no other signs of past Aboriginal occupation. Moreover, James and Fife [i.e., Rosalind James and Ray Fife] were of the opinion that the slopes and their wooded nature would not have allowed the sort of attack from above being described.

In addition to 'The Pocket', Davidson and Lovell-Jones (1993: 20) report that two of the archaeologists involved in the archaeological survey component of the Bayswater No.3 Colliery, namely Rosalind James and Ray Fife, were told of "another possible site of the same, or another, massacre" while surveying in the field. This site was located in a gully behind the property of 'Belmont', itself located around 3 km southwest of Mount Arthur, on the northern side of Saddlers Creek (Figure 16). However, "this rumour was not corroborated by any of the other informants" (Davidson and Lovell-Jones, 1993: 20).

In offering their conclusions on the massacre reported by their informants, Davidson and Lovell-Jones (1993: 27) stressed the point that, while their inquiry failed to identify any documentary evidence of a massacre within the Mount Arthur area, the oral histories provided by their informants were to be considered equally authoritative.

Figure 16 Map showing the location of ‘The Pocket’, adjacent to Mount Arthur proper, as well as Belmont homestead. The gully behind the property Belmont is also marked

3.3 Resilience and Adaption

Perhaps predictably, historical accounts of Aboriginal-European relations within the Hunter Valley have tended to focus on the violence that took place across the valley during the first two decades of European settlement, with other aspects of interaction, such as co-operation, friendship and positive working relationships, largely overlooked. For the Hunter Valley, in particular, the historical emphasis on Aboriginal-settler conflict has obscured what available historical sources indicate a complex pattern of interaction. As Dunn (2015: 236) has stressed, the reaction of the valley's resident Aboriginal population to the invasion of their Country:

...was a complex and varied one. Violence and confrontation was one response, with clashes particularly intense during the period between the mid-1820s and mid-1830s as more Europeans moved into the valley. The drama and tragedy of the violence on both sides of the frontier, which for many people was inescapable, has in part obscured the cooperation, friendships and working relationships that also formed throughout the region during the same period. Some relationships transitioned through friendship, violence and co-existence: these highlight the blurred and fluid nature of alliances and affiliations in the colonial Hunter.

As in other parts of New South Wales and Australia more broadly, the majority of Aboriginal-European interaction across the Hunter Valley in the years following the region's colonisation by Europeans was "driven by the need for and value of Aboriginal labour, which was the most important component of the exchange between the two cultures" (Dunn, 2017: 44). Recent considerations of Aboriginal peoples' involvement in the colonial economy of the Hunter Valley (e.g., Blyton, 2012; Dunn, 2015, 2017) have highlighted the many and varied roles that Aboriginal played in its establishment and operation. Alongside their frequent appointment as guides and trackers, Aboriginal people were regularly employed on the estates and farms of the region for tasks such as shepherding, shearing, harvesting, clearing land, cutting wood, stripping bark, carrying water and tracking lost animals (for a detailed review see (Dunn 2017)).

Specific to the study area and environs, AECOM has been unable to identify any documentary evidence of Aboriginal people having worked on the two major estates of this area: George Bowman's 'Arrowfield' and James Robertson's 'Plashett'. Nonetheless, it is highly considered likely that Aboriginal people were employed to work on one or both of these estates in some capacity at some time. Indeed, as Dunn (2017:55) has observed, "[b]etween the opening of the Hunter Valley to settlement in the early 1820s and the middle of the century, most if not all of the colonial estates and farms in the Hunter Valley employed Aboriginal workers...".

3.4 Mount Arthur Burial

The burial site at Mount Arthur was noted by RAPs as being an important cultural site within the local area. The burial, originally identified by Kuskie (2000), was uncovered as part of salvage works completed by Kuskie & Clarke (2004) for the Mt Arthur Mine. Little has been made publicly available. However, AECOM understands that the burial was left *in-situ* but is located outside the study area and would not be impacted by the Project.

Available historical records suggest that burial in the earth was the most common form of burial practised by Aboriginal groups occupying the Hunter Valley at contact, with tea tree bark widely used as a burial shroud (Fawcett 1898:180; McKiernan 1911:889; Miller 1887:354; Scott 1929: 3; Threlkeld in Gunson 1974:47, 89, 100). Grave goods consisted of items of personal gear such as spear and hatchets (McKiernan 1911: 889; Threlkeld in Gunson 1974: 47, 89, 100). Cremation is also known to have been practiced but is poorly represented in the historical record (Threlkeld in Gunson 1974: 99).

3.5 Archaeology in the Study Area

The archaeological investigation completed for the assessment has revealed 275 Aboriginal archaeological sites, comprising 274 open artefact sites (i.e., artefact scatters and isolated artefacts) and one stone quarry. RAPs involved in the assessment have noted that all Aboriginal sites are of significance to contemporary Aboriginal people. A detailed description of the identified sites is provided in the Project's ACHAR.

3.6 Raw Material Sources and Quarries

RAPs participating in the assessment noted that stone raw material sources used for making stone tools were important to Aboriginal people forming part of their subsistence strategies and the broader cultural landscape. As explained in elder Michael Green in *Pathways Across the Hunter* (OEH 2011b):

stone materials used by Aboriginal people and the sites where they are found can provide a rare glimpse into the fabric of past Aboriginal society and can increase our knowledge of past Aboriginal land use and ways of life. These sites are an important link for Aboriginal people today linking with their culture and their past. Quarry sites such as these can tell us a lot about Aboriginal stone tools, such as the types of stone used and shown stone was obtained (OEH 2011b:6)

In particular, gravels available from the Hunter River (the Hunter River Gravels) were identified by RAPs as an important resource. The Hunter River Gravels are a well-known source of indurated mudstone, often referred to as tuff (see Hughes et al. 2011 for a discussion), silcrete, and quartz raw material that was utilised by Aboriginal people in the manufacture of stone tools in the Central Lowlands. The gravels are exposed at numerous locations along the Hunter River, both as active gravel bars within the creek channel and on former terraces. Gravel locations have been noted at Muswellbrook, Denman, Jerrys Plains and Singleton (Dean-Jones & Mitchell 1993). However, as Esteves (1999) has suggested, when discussing the location of these gravels, it is important to note that the Hunter River's alignment is considerably different today than it was prior to European settlement. This is due to channel modifications, land management practices, and natural processes, the implication being that the Hunter River gravels may be located adjacent to old channelisation at a considerable distance from its current channel. In addition, current gravel exposures may not necessarily have been accessible to Aboriginal people in the past.

In an assessment of several Hunter River gravel bars MacDonald & Davidson (1998) found that the bars consist primarily of local materials, reflecting the River's underlying geology, and smaller deposits of non-local material transported from other parts of the system. Both indurated mudstone/tuff and silcrete are considered locally derived; indurated mudstone/tuff being part of the Singleton Supergroup, and silcrete being derived from Tertiary fluvial sands and gravels. Surveys undertaken by Esteves (1999) along the Hunter River concluded that while these raw materials are present throughout the Hunter River gravel bars, there is spatial variability in their availability.

In addition to the Hunter River Gravels, two tertiary deposits of stone (i.e., silcrete and tuff) suitable for stone tool production have been previously identified within the study area by Mills (2000). These include AHIMS registered sites 'SC-QS-2' (ID#3-37-2-1954) and 'SC-QS-1' (ID#37-2-1955). Reference to the site card for SC-QS-2 indicates this site covers an area of approximately 500 m² and comprises numerous silcrete, chert, mudstone and quartzite cobbles/boulders scattered across a wide area. The site card notes evidence of use including the presence of a large number of cores and flakes, both primary and secondary. AECOM's inspection of the area likewise identified a large number of silcrete and chert cobbles/boulders dispersed over a large area. However, AECOM found the number of artefacts associated with the cobbles/boulders was relatively small with only a handful identified. It was concluded that while the site meets the broad definition of what constitutes a quarry (i.e., "the location of an exploited stone source" [Hiscock & Mitchell (1993)] evidence of on-source reduction activities were limited. As discussed below, researchers in the Hunter Valley have contended quarrying at a location may take the form of assaying (and cobble rejection) to systematic reduction activities (i.e., flaking and heat shattering of stone) (Jones & White, 1988; White 1998; Moore 2000). In relation to site SC-QS-2, the former (i.e., assaying) is more consistent with evidence observed at the site. The primary activity likely to have taken place onsite is raw material selection with limited knapping, and selected material potentially transported elsewhere for reduction.

Reference to the site card for SC-QS-1 indicates the site covers an area of 150 m x 30 m with cobbles/boulders of mudstone, silcrete, chert, fossilised wood and river pebbles having been identified. Despite several attempts, AECOM was unable to locate the cobbles/boulders described in the site card in the vicinity of the registered site location. Mills' (2000) description of the site contains no information of the number and types of artefacts located at the site. However, photographs of artefacts identified at the site are provided in the report (Mills 2000).

In relation to quarry sites in the Hunter Valley more broadly and reduction activities associated with raw material sources, Moore (2000:29) divides these into on-source reduction activities and off-source reduction, and notes that both were practiced by Hunter Valley knappers, with procurement generally focused on the Hunter River Gravels. As discussed above, researchers in the Hunter Valley have contended that evidence of quarrying at gravel sources will tend to produce a low density background scatter of flakes and flaked cobbles that are the results of assaying through to high densities associated with systematic reduction activities (i.e., flaking and heat shattering of stone) (Jones & White, 1988; White 1998; Moore 2000). Moreover, on-source reduction is argued to produce flake blanks considerably larger than those produced off-source, with the blanks considered to be early stages in the reduction sequence (Hiscock & Mitchell 1993; Moore 2000). Heating may also have also been utilised to split boulders into more manageable packages (White 1998). Moore (1997) suggests that raw material procurement and on-site reduction may have been undertaken during logistical forays or 'embedded' during the carrying out of subsistence tasks.

Existing artefact assemblage data for the Hunter Valley indicate that Aboriginal people utilised a diverse range of lithic raw materials for flaked stone artefact manufacture albeit with a focus on silcrete and silicified tuff. Other, less-commonly exploited raw materials, such as quartz, quartzite, chalcedony, chert, petrified wood and various fine-grained volcanics have also been identified. Accordingly, quarry sites in the Hunter Valley would be expected to contain exploitable clasts of these materials with higher frequencies of silcrete and silicified tuff.

In context of the Hunter Valley, Aboriginal stone quarry sites are a comparatively rare component of the archaeological record, with only eight instances, for example, recorded on the AHIMS database (search completed in 2012) of which two are recorded as potential raw material sources without associated evidence of exploitation. The remaining six sites vary in relation to raw materials present, intensity of use and their topographical locations. A review of available site cards for the sites indicates that exposed silcrete cobbles of varying sizes were an almost universally present raw material, being recorded at five of the six locations and exclusively at three locations. Cobbles of silicified tuff (i.e., mudstone, chert) were recorded, alongside silcrete at three sites, and quartzite/quartz at three locations. Estimates of the total number of artefacts were recorded on only four site cards with artefacts numbers ranging from five to several hundred. In three instances, initial stages of reduction were noted, including shattered cobbles, large flakes and minimally modified cores. In almost all cases, quarry sites were recorded within 1 km of the Hunter River or its major tributaries, amongst alluvial and colluvial gravel deposits. Despite the presence of quarry sites in both the Upper and Lower Hunter Regions, only one has been excavated and subject to detailed investigation - the B10 quarry site (White 1998).

3.7 Plant Resources

Although available historical records provide only limited insight into Aboriginal exploitation of plants within the Hunter Valley (Brayshaw, 1987: 74), it can be confidently asserted that the original vegetation communities of the study area would have supplied Aboriginal people camping within, and passing through the site, with an extensive array of edible and otherwise useful plant species. Recorded native vegetation communities and locally occurring wetland will likewise have supported a large and diverse range of economic terrestrial, aquatic and avian fauna. Historical evidence for the Aboriginal exploitation of faunal and floral resources within the Lower Hunter Valley is discussed in further detail in the ACHAR for this project. A review of economic plant species utilised by Aboriginal published in existing literature (see Cribb & Cribb 1974; Isaacs 2002; Lassak & McCarthy 2001; Stewart & Percival 1997; and Zola & Gott 1992) cross-referenced with the flora surveys undertaken by Hunter Eco (2019) suggest a number of useful plant species utilised by Aboriginal people are located within the study area. Table 4 provides a list of plant species known to have been used by Aboriginal people and their uses that are available within the study area.

Table 4 Economic plant species identified within the Project area

Botanical name	Common name	Potential Use(s)	Reference(s)
Acacia spp.	Acacia	Seeds & gum edible; wood suitable for making range of implements; bark & gum have medicinal properties	Stewart & Percival, 1997
Eucalypt spp.	Eucalypts	Bark has multiple uses (e.g., shelter, shields, baskets, fish nets); wood suitable for making range of implements (e.g., spears, clubs); leaves, gum & bark have medicinal properties	Stewart & Percival, 1997; Isaacs, 2002
<i>Lomandra longifolia</i>	Spiny-headed Matrush	Leaf bases and flowers edible; leaves can be used to make baskets	Stewart & Percival, 1997
<i>Typha orientalis</i>	Cumbungi	Rhizomes edible after roasting; fibres can be used to make string; young shoots can be eaten raw; flower spikes can be steamed and eaten	Stewart & Percival, 1997
<i>Xanthorrhoea johnsonii</i>	Grass Tree	Leaves produce hard waterproof resin that melts when warmed as can be used as binding agent; flowers can be sucked or soaked in water to make sweet drink; leaf bases and growing points edible	Stewart & Percival, 1997
<i>Phragmites australis</i>	Common Reed	Roots edible; Straight flowering stems can be used as spear shafts; leaves can be twisted into rope	Zola & Gott, 1992: 12
<i>Arthropodium minus</i>	Small Vanilla Lily	Tubers edible	Zola & Gott, 1992: 25
<i>Clematis glycinoides</i>	Headache Vine	Roots edible; crushed leaves can be inhaled to relieve headache	Zola & Gott, 1992: 25
<i>Eustrephus latifolius</i>	Wombat Berry	Tuberous roots edible	Cribb & Cribb, 1974: 174

Botanical name	Common name	Potential Use(s)	Reference(s)
<i>Caesia parviflora</i>	Pale Grass-lily	Tubers edible	Zola & Gott, 1992: 44
<i>Angophora floribunda</i>	Rough-barked Apple	Sap has medicinal properties	Lassak & McCarthy, 2001
<i>Pterostylis</i> spp.	Greenhood orchids	Tubers edible	Zola & Gott, 1992: 46
<i>Geranium</i> spp.	Native Geranium	Tubers edible	Zola & Gott, 1992: 47
<i>Billardiera scandens</i>	Apple-berry	Fruits edible	Zola & Gott, 1992: 49
<i>Themeda australis</i>	Kangaroo Grass	Seeds edible (ground and baked as cakes); leaves and stems contain fibre that can be used to produce string	Zola & Gott, 1992: 58
<i>Poa</i> sp.	Tussock grass	Fibre from grass can be used to make string nets for nets, baskets and mats.	Zola & Gott, 1992: 58
<i>Panicum effusum</i>	Hairy panic grass	Seeds edible (ground and baked)	Issacs, 2002: 226

4.0 Summary of Findings

Consultation with RAPs for the Project finds that the cultural heritage values of the study area rest principally with the archaeological sites identified within it, but also are drawn from its place within the broader cultural landscape. Identified archaeological sites within the study area attest to its past use by Aboriginal people and these sites have been identified by RAPs as all highly significant.

More broadly, the study area forms part of a larger and highly significant cultural landscape for Aboriginal people in the Muswellbrook region with Mount Arthur, the Hunter River and Saddlers Creek being three culturally significant landscape features in the local area. While no specific pathways have been identified within the study area, it nonetheless was likely utilised by Aboriginal people travelling to and from Mount Arthur, which is visible from multiple locations within the study area. Likewise, both the Hunter River and Saddlers Creek were likely accessed from places from within the study area by Aboriginal people seeking to exploit the diverse range of terrestrial, aquatic and avian resources associated with these watercourses. All three culturally significant landscape features are visible from specific sites/locations within the study area and are considered to hold aesthetic significance.

The three culturally significant landscape features have been identified by RAPs as relevant to the study area, Mount Arthur, the Hunter River and Saddlers Creek, are located outside the study area and would not be directly impacted by the Project. However, views of the mine entry area and portions of the transport and services corridor would be visible from both Mount Arthur and Saddlers Creek. Nonetheless, consideration of the small size of the mine entry area and the transport and services corridor, suggests these visual impacts would be minor. Visual impacts to the Hunter River would be fully avoided with the mine entry area and transport and services corridor not visible from any location on the Hunter River.

5.0 Acknowledgments

Malabar and AECOM would like to acknowledge the Traditional Owners of the study area, the Wonnarua People, and pay respect to their cultural heritage, beliefs and continuing connection to the land. We also would like to pay respect to the Elders past, present and future and to all Aboriginal People who participated in the assessment.

OEH Submission

Aboriginal cultural heritage
<p>5. The Environmental Impact Assessment (EIS) must identify and describe the Aboriginal cultural heritage values that exist across the whole area that will be affected by the development and document these in the Aboriginal Cultural Heritage Assessment Report (ACHAR). This may include the need for surface survey and test excavation. The identification of cultural heritage values should be guided by the Guide to investigating, assessing and reporting on Aboriginal Cultural Heritage in NSW (DECCW, 2011) and consultation with OEH regional branch officers.</p>
<p>6. Consultation with Aboriginal people must be undertaken and documented in accordance with the Aboriginal cultural heritage consultation requirements for proponents 2010 (DECCW). The significance of cultural heritage values for Aboriginal people who have a cultural association with the land must be documented in the ACHAR.</p>
<p>7. Impacts on Aboriginal cultural heritage values are to be assessed and documented in the ACHAR. The ACHAR must demonstrate attempts to avoid impact upon cultural heritage values and identify any conservation outcomes. Where impacts are unavoidable, the ACHAR must outline measures proposed to mitigate impacts. Any objects recorded as part of the assessment must be documented and notified to OEH.</p>

Dear Sir/Madam,

Request for Relevant Aboriginal Stakeholder Information for the Maxwell Project located in Muswellbrook and Singleton LGAs, NSW

I am writing to inform you that AECOM Australia Pty Ltd (AECOM) has been commissioned by Malabar Coal Limited to undertake an Aboriginal cultural heritage assessment for the Maxwell Project located to the east of Denman and south of Muswellbrook, within the local government areas of Muswellbrook and Singleton (the 'Area of Interest', Figure 1).

The Maxwell Project would extract coal through underground mining within the Wittingham Coal Measures for a mine life of approximately 26 years. The Maxwell Project would include the development of a mine infrastructure area adjacent to the mine entry. Coal when mined would be transferred to existing coal preparation and train loading infrastructure for processing and dispatch to markets. The Proponent for the Project is Maxwell Ventures (Management) Pty Ltd, a wholly owned subsidiary of Malabar Coal Limited (Level 26, 259 George Street, Sydney NSW 2000).

The purpose of this letter is to request from you, in accordance with cl 80C(2)(a) of the *National Parks and Wildlife Regulation 2009* and Section 4.1.2 of the Office of Environment and Heritage's (OEH) *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW 2010), the name and contact details of Aboriginal individuals and/or organisations whom you consider may hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects/places in the Area of Interest, and who may be interested in being consulted. Could you please provide these details by 14 June 2018.

Should you have information regarding the above or have any questions, please don't hesitate to contact:

PO Box 314
SINGLETON 2330

Dear Sir/Madam,

Request for Relevant Aboriginal Stakeholder Information for the Maxwell Project located in Muswellbrook and Singleton LGAs, NSW

I am writing to inform you that AECOM Australia Pty Ltd (AECOM) has been commissioned by Malabar Coal Limited to undertake an Aboriginal cultural heritage assessment for the Maxwell Project located to the east of Denman and south of Muswellbrook, within the local government areas of Muswellbrook and Singleton (the 'Area of Interest', Figure 1).

The Maxwell Project would extract coal through underground mining within the Wittingham Coal Measures for a mine life of approximately 26 years. The Maxwell Project would include the development of a mine infrastructure area adjacent to the mine entry. Coal when mined would be transferred to existing coal preparation and train loading infrastructure for processing and dispatch to markets. The Proponent for the Project is Maxwell Ventures (Management) Pty Ltd, a wholly owned subsidiary of Malabar Coal Limited (Level 26, 259 George Street, Sydney NSW 2000).

The purpose of this letter is to request from you, in accordance with cl 80C(2)(a) of the *National Parks and Wildlife Regulation 2009* and Section 4.1.2 of the Office of Environment and Heritage's (OEH) *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW 2010), the name and contact details of Aboriginal individuals and/or organisations whom you consider may hold cultural knowledge relevant to determining the cultural significance of Aboriginal objects/places in the Area of Interest, and who may be interested in being consulted. Could you please provide these details by 14 June 2018.

Should you have information regarding the above or have any questions, please don't hesitate to contact:

Native title search – NSW within Singleton and Muswellbrook Shire Council LGA
Your ref: N/A - Our ref: SR4375

Dear Georgie Oakes,

Thank you for your search request received on 13 June 2018 in relation to the above area, please find your results attached.

Please note: Where the area identified to be searched is indistinct, generalised, or is for a freehold parcel, the results provided may relate to the Local Government Area (LGA) or Local Aboriginal Land Council (ALC).

Search Results

The results provided are based on the information you supplied and are derived from a search of the following Tribunal databases:

- Schedule of Native Title Determination Applications
- Register of Native Title Claims
- Native Title Determinations
- Register of Indigenous Land Use Agreements
- Notified Indigenous Land Use Agreements

For more information about the Tribunal's registers or to search the registers yourself and obtain copies of relevant register extracts, please visit our [website](#).

Please note: There may be a delay between a native title determination application being lodged in the Federal Court and its transfer to the Tribunal. As a result, some native title determination applications recently filed with the Federal Court may not appear on the Tribunal's databases.

The search results are based on analysis against external boundaries of applications only. Native title applications commonly contain exclusions clauses which remove areas from within the external boundary. To determine whether the areas described are in fact subject to claim, you need to refer to the "Area covered by claim" section of the relevant Register Extract or Schedule Extract and any maps attached.

Search results and the existence of native title

Please note that the enclosed information from the Register of Native Title Claims and/or the Schedule of Applications is not confirmation of the existence of native title in this area. This cannot be confirmed until the Federal Court makes a

determination that native title does or does not exist in relation to the area. Such determinations are registered on the National Native Title Register.

The Tribunal accepts no liability for reliance placed on enclosed information

The enclosed information has been provided in good faith. Use of this information is at your sole risk. The National Native Title Tribunal makes no representation, either express or implied, as to the accuracy or suitability of the information enclosed for any particular purpose and accepts no liability for use of the information or reliance placed on it.

If you have any further queries, please do not hesitate to contact us on the free call number 1800 640 501.

Regards,

Mr Geordie Oaks
AECOM Australia Pty Ltd
geordie.oaks@aecom.com

Dear Geordie

Maxwell Project

In response to your request under Section 4.1.2(a) of the *Aboriginal cultural heritage consultation requirements for proponents* (DECCW 2010), please find attached a list of known Aboriginal parties that have self-nominated for the Muswellbrook Shire Council and Singleton Council Local Government Areas (LGA). Please note the following information with respect to Aboriginal consultation for your project.

Aboriginal stakeholder lists maintained by OEH are comprised of self-nominated individuals and organisations

Please note that the attached list is comprised only of self-nominated individuals and Aboriginal organisations who could have an interest in your project. The list is not vetted by OEH. As the list comprises only of self-nominated individuals and Aboriginal organisations, it is not necessarily an exhaustive list of all Aboriginal parties who may hold an interest in the project. Further consultation in accordance with step 4.1.2 of the *Aboriginal cultural heritage consultation requirements for proponents* (DECCW 2010) is required to identify Aboriginal people who may hold either cultural or historical knowledge relevant to determining the significance of Aboriginal objects or places within your proposed project area.

Ensure you document the consultation process

Please ensure all consultation undertaken in accordance with the *Aboriginal cultural heritage consultation requirements for proponents* (DECCW 2010) is documented within an Aboriginal Cultural Heritage Assessment Report (ACHAR). This must include copies of all correspondence sent to or received from all Registered Aboriginal Parties (RAPs) throughout the entire consultation process. Omission of these records in the final ACHAR may cause delays in the assessment of an Aboriginal Heritage Impact Permit (AHIP) application or a major project Aboriginal cultural heritage assessment, and could require parts of the consultation process to be repeated if the evidence provided to OEH does not demonstrate that the consultation process has been conducted in accordance with our consultation requirements.

Demonstrate that reasonable consultation attempts have been made

Please ensure you provide evidence to demonstrate that reasonable attempts have been made to contact the relevant parties identified through step 4.1.2 of the *Aboriginal cultural heritage consultation*

requirements for proponents (DECCW 2010). If this evidence is not provided, OEH may deem that the consultation process has not complied with the consultation requirements. Similarly, the proponent is required to record all feedback received from RAPs, along with the proponent's response to the feedback. Where concerns or contentious issues are raised by RAPs during the consultation process, OEH expects that reasonable attempts are made to address and resolve these matters, however OEH acknowledges that in some cases, this may not be achievable. In the case where conflict cannot be resolved, it is the responsibility of the proponent to record these differences and provide the necessary information in their ACHAR with their AHIP application or major project ACHAR.

Consultation should not be confused with employment

As outlined in Section 3.4 of the *Aboriginal cultural heritage consultation requirements for proponents* (DECCW 2010), the consultation process involves getting the views of, and information from, Aboriginal people and reporting on these. It is not to be confused with other field assessment processes involved in preparing a proposal and an application. OEH does not have any role with respect to commercial engagement. Where RAPs are engaged commercially to provide field services as part of an assessment process, that is a matter for the proponent to manage as they see fit. However, if a proponent is proposing to undertake consultation processes or elicit cultural information from RAPs during the course of conducting a field survey, OEH considers this to form part of the consultation process, and expects that all RAPs would be afforded the opportunity to be involved in the process.

Contacting our office

To ensure we can respond to enquiries promptly, please direct future correspondence to our central mailbox: rog.hcc@environment.nsw.gov.au.

Should you require any further information, please do not hesitate to contact us.

Yours sincerely

SYDNEY NSW 2000

Dear Geordie

Re: Request - Search for Registered Aboriginal Owners

I refer to your letter dated 28 May 2018 regarding an Aboriginal Cultural Heritage Assessment of the proposed Maxwell project located within Muswellbrook and Singleton LGA, NSW.

I have searched the Register of Aboriginal Owners and the project area described does not have Registered Aboriginal Owners pursuant to Division 3 of the Aboriginal Land Rights Act 1983.

I suggest that you contact Wanaruah Local Aboriginal Land Council on 02 6543 1288. They may be able to assist you in identifying other Aboriginal stakeholders for this project.

Yours sincerely

A handwritten signature in grey ink, appearing to read "Jodie Rikiti".

Subject: Response to request for aboriginal stakeholder information - Maxwell Project located in Muswellbrook and Singleton LGA

Good afternoon Georgie

Council would consider the Wonnarua Nation Aboriginal Corporation to be the body/organisation best placed to advise on Aboriginal objects/places in the area of interest.

Their website is below and contains contact details and other relevant information.

<https://www.wonnarua.org.au/>

If there is anything else I can assist with, please get in touch.

Thanks

Aboriginal Cultural Heritage Assessment

Maxwell Project

Muswellbrook and Singleton LGA, NSW

Maxwell Ventures (Management) Pty Ltd (ACN 002 028 257), a wholly owned subsidiary of Malabar Coal Limited

Level 26, 259 George Street, Sydney NSW 2000

Notice given under cl 80(2)(c) of the *National Parks and Wildlife Regulation 2009* and Section 4.1.3 of the *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010*

AECOM on behalf of Malabar Coal Limited is seeking to identify Aboriginal persons or organisations who wish to be consulted in relation to an Aboriginal Cultural Heritage Assessment being prepared for the Maxwell Project. The Maxwell Project is located in the Upper Hunter Valley, to the east of Denman and south of Muswellbrook, adjacent to Edderton Road. The Maxwell Project would extract coal using underground mining methods and would include the development of a mine infrastructure area adjacent to the mine entry. Coal when mined would be transferred to existing coal preparation and train loading infrastructure for processing and dispatch to markets.

Approval for the Maxwell Project would be sought under the State Significant Development provisions (Division 4.7) of Part 4 of the Environmental Planning and Assessment Act 1979 (EP&A Act) and the NSW Environmental Planning and Assessment Regulation, 2000.

The purpose of community consultation with Aboriginal people is to assist the proposed applicant in the preparation of an application for an Aboriginal Heritage Impact Permit and to assist the Director General of OEH in his or her consideration and determination of the application.

Interested Aboriginal persons or stakeholders who hold cultural knowledge relevant to determining the significance of Aboriginal object(s) and/or place(s) in the Area of Interest and wish to participate in a process of community consultation with the proponent regarding the proposed activity are requested to register their interest in writing to:

Geordie Oakes
c/- AECOM Australia Pty Ltd
PO Box Q410, QVB Post Office,
Sydney, NSW 1230
Ph: +61 2 8934 0610
Fax: +61 2 8934 0001
Email: Geordie.Oakes@aecom.com

Please be advised that if you register an interest in consultation, your details will be forwarded to the Office of Environment and Heritage and the Wanaruah Local Aboriginal Land Council, unless you specify that you do not want your details released. The closing date for registration is 4/07/18.

OEH and LALC Notification

20 September 2018

Wanaruah Local Aboriginal Land Council
PO Box 127
Muswellbrook NSW 2333

To Whom it May Concern,

Notification of Registered Aboriginal Parties (RAPs) for the Maxwell Project located in Muswellbrook LGA, NSW

In accordance with Section 4.1.6 of OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010*, please find enclosed for your records a list of the Aboriginal organisations and individuals who have registered an interest in being consulted for an Aboriginal Cultural Heritage Assessment being undertaken by AECOM Australia Pty Ltd (AECOM) for the proposed for the Maxwell Project, located in Muswellbrook LGA, NSW.

As was stated in the letters of invitation issued to Aboriginal organisations and individuals requesting registrations of interest, the official registration period for this project closed on 4 July 2018. However, registrations received after the closing date were accepted. A copy of the invitation is attached to this letter as well as the newspaper advertisement stakeholder request.

A total of 25 registrations of interest have been received regarding consultation for this project (Table 1). Please note that in accordance with Section 4.1.5 of the Consultation Requirements, AECOM provides the opportunity for Registered Aboriginal Parties (RAPs) to withhold their details from being forwarded on to the Local Aboriginal Land Council and/or OEH, and respects the wishes of RAPs to withhold their details at their discretion. No RAPs requested that their details be withheld in regard to this project.

PO Box 184
SINGLETON NSW 2330

Dear Sir/Madam,

RE: Aboriginal Community Consultation for the Maxwell Project located in Muswellbrook and Singleton LGAs, NSW

I am writing to inform you that AECOM Australia Pty Ltd (AECOM) has been commissioned by Malabar Coal Limited to undertake an Aboriginal cultural heritage assessment for the Maxwell Project located to the east of Denman and south of Muswellbrook, within the Muswellbrook and Singleton local government areas (the 'Area of Interest', Figure 1).

The Maxwell Project would extract coal through underground mining within the Wittingham Coal Measures for a mine life of approximately 26 years. The Maxwell Project would include the development of a mine infrastructure area adjacent to the mine entry. Coal when mined would be transferred to existing coal preparation and train loading infrastructure for processing and dispatch to markets.

The Proponent for the Project is Maxwell Ventures (Management) Pty Ltd, a wholly owned subsidiary of Malabar Coal Limited (Level 26, 259 George Street, Sydney NSW 2000).

You have been identified by the Office of Environment and Heritage (OEH) as an Aboriginal person or organisation with the potential to hold cultural knowledge relevant to determining the significance of Aboriginal objects and places within the area of interest. Accordingly, AECOM is inviting you to participate in community consultation for this project.

To register your interest to be consulted about this project, please contact the following:

Geordie Oakes
c/- AECOM Australia Pty Ltd
PO Box Q410, QVB Post Office,
Sydney, NSW 1230
Ph: +61 2 8934 0610
Fax: +61 2 8934 0001
Email: geordie.oakes@aecom.com

To be involved in the consultation process, registrations must be received by 4 July 2018.

This notification is given in accordance with cl 80C (2)(b) of the *National Parks and Wildlife Regulation 2009* and section 4.1.3 of the Office of Environment and Heritage's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW, 2010). The purpose of community consultation with Aboriginal people is to assist the proposed applicant in the preparation of an application for an Aboriginal Heritage Impact Permit and to assist the Director General of OEH in his or her consideration and determination of the application.

Please be advised that if you register an interest in consultation, your details will be forwarded to the Office of Environment and Heritage and the Wonnarua Local Aboriginal Land Council, unless you specify that you do not want your details released.

AECOM Imagine it.
Delivered.

Kind regards,

Geordie Oakes

To Whom it May Concern,

Notification of Registered Aboriginal Parties (RAPs) for the Maxwell Project located in Muswellbrook LGA, NSW

In accordance with Section 4.1.6 of OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010*, please find enclosed for your records a list of the Aboriginal organisations and individuals who have registered an interest in being consulted for an Aboriginal Cultural Heritage Assessment being undertaken by AECOM Australia Pty Ltd (AECOM) for the proposed for the Maxwell Project, located in Muswellbrook LGA, NSW.

As was stated in the letters of invitation issued to Aboriginal organisations and individuals requesting registrations of interest, the official registration period for this project closed on 4 July 2018. However, registrations received after the closing date were accepted. A copy of the invitation is attached to this letter as well as the newspaper advertisement stakeholder request.

A total of 25 registrations of interest have been received regarding consultation for this project (Table 1). Please note that in accordance with Section 4.1.5 of the Consultation Requirements, AECOM provides the opportunity for Registered Aboriginal Parties (RAPs) to withhold their details from being forwarded on to the Local Aboriginal Land Council and/or OEH, and respects the wishes of RAPs to withhold their details at their discretion. No RAPs requested that their details be withheld in regard to this project.

Draft Assessment Methodology

19 July 2018

Dear Stakeholder,

RE: Proposed Aboriginal Cultural Heritage Assessment Methodology for the Maxwell Project

AECOM Australia Pty Ltd (AECOM) is commissioned by Malabar Coal Limited to prepare an Aboriginal Cultural Heritage Assessment (ACHA) for the Maxwell Project, a proposed underground coal mine, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area of Muswellbrook, NSW.

Please find enclosed for your review the proposed assessment methodology for the ACHA being completed for the project. This draft assessment methodology details the proposed approach to the assessment and is being provided to all Registered Aboriginal Parties (RAPs) in accordance with Sections 4.3.1 and 4.3.2 of the NSW Office of Environment and Heritage's *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW, 2010). A brief review of existing environmental and archaeological data for the study area is also provided to give context for the proposed assessment methodology.

Malabar Coal Limited will be holding an ACHA information session at the Maxwell Project site offices (previously the Drayton Mine site office – see Figure 1 below) located on Thomas Mitchell Drive, Muswellbrook, at 10 am on Friday 10 August 2018. The purpose of the meeting will be to provide RAPs with project information and discuss the proposed assessment methodology. To register your interest in attending the ACHA information session please contact Geordie Oakes via the contact details provided below. Please note, attendance at the information session will not be paid.

Aboriginal site officers will be required to assist with site assessment works for this project. If you would like to be considered for site assessment work, please forward a copy of relevant business insurances (i.e., public liability insurance and NSW workers compensation insurance) to Geordie Oakes by COB 10 August 2018 via the contact details provided below.

All comments on the proposed methodology must be received by COB 21 August 2018. Comments can be provided in writing, by phone or at the ACHA information session. Comments on the cultural values of the study area can be provided along with your comments on the proposed methodology or at any stage up until the end of the draft ACHA review period.

Figure 1: Location of Maxwell Administration Building

Maxwell Project: Aboriginal Cultural Heritage Assessment Proposed Methodology

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) is commissioned by Malabar Coal Limited to prepare an Aboriginal Cultural Heritage Assessment (ACHA) for the Maxwell Project, a proposed underground coal mine, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area of Muswellbrook, NSW.

The objectives of the ACHA are to identify the Aboriginal heritage values, both archaeological and cultural, of the study area and to determine appropriate mitigation and/or management measures. The assessment will involve background research, Aboriginal community consultation, archaeological field survey and the production of an ACHA report.

In accordance with the Office of Environment and Heritage's (OEH) *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW, 2010a), AECOM is providing for your review a proposed (draft) assessment methodology for the Project.

Aboriginal stakeholders are invited to comment on this draft methodology and to provide comments regarding the Aboriginal heritage cultural values of the study area.

2.0 Background to the Current Assessment

The Maxwell Project is located across land previously assessed by AECOM (2012, 2015) for the former Drayton South Coal Project. The former Drayton South Coal Project included the proposed development of a new open cut mine within EL 5460. A comprehensive archaeological survey was undertaken by AECOM for this project over 28 days in 2011 that resulted in the identification of 205 Aboriginal sites including 202 open artefact sites and three stone quarries.

Open cut mining has been prohibited within EL 5460 under the *State Environmental Planning Policy (Mining, Petroleum Production and Extractive Industries) 2007* (Mining SEPP) and the conditions of EL 5460.

In February 2018, Malabar Coal Limited acquired Exploration Licence (EL 5460) and the Drayton Mine assets (now known as the Maxwell Infrastructure).

As part of its acquisition of EL 5460, Malabar committed to develop the Maxwell Project solely as an underground mining operation

3.0 Project Overview

The Maxwell Project would extract coal through underground mining methods within the Wittingham Coal Measures over a period of approximately 26 years.

The Maxwell Project underground mining area would be located entirely within EL 5460 (Figure 1). The Maxwell Project would utilise the existing Maxwell Infrastructure plus require the development of some new infrastructure. Coal when mined would be transferred to existing coal handling, processing and train loading infrastructure at the Maxwell Infrastructure prior to dispatch to markets.

The majority of surface infrastructure required for the Maxwell Project is in place, having been constructed around 30 years ago.

The Project would produce high quality coals with the majority capable of being used for steel-making. The balance would be export thermal coals suitable for the new generation High Efficiency Low Emissions power generators.

The Project would include a number of key components (Section 4, Figure 1), some of which require surface disturbance, including:

1. Mine entry area to access the underground mining areas – approximately 70 hectares (ha).
2. Transport corridor – approximately 80 ha outside of the existing mining disturbance.
3. Potential for re-alignment of Edderton Road – approximately 10 ha.
4. Other works and ancillary infrastructure – up to approximately 10 ha.
5. Subsidence zone – area within the underground mining area and surrounds.

Mine Entry Area

The mine entry area would include infrastructure, services and facilities that would support underground mining and coal handling activities and provide personnel and materials access for the underground mine. The mine entry area would also include ventilation infrastructure.

Transport Corridor

The transport corridor would include:

- an internal access road from the Maxwell Infrastructure; and
- an overland coal conveyor system to transport run-of-mine (ROM) coal from the mine entry area to the existing coal handling and preparation plant (CHPP) at the Maxwell Infrastructure.

The transportation of early ROM coal from the mine entry area to the existing CHPP would also occur via the internal roads within the transport corridor.

Edderton Road Realignment

Edderton Road may require realignment around the underground mining area. The need for this realignment will be informed by consultation with key stakeholders (e.g. Muswellbrook Shire Council) during the EIS process. The potential Edderton Road realignment would intersect the Golden Highway approximately 1km to the west of the current intersection.

Other Works and Ancillary Infrastructure

Other works and ancillary infrastructure would be required outside of the defined surface development areas throughout the life of the Project. These works would include, but not be limited to, environmental and subsidence monitoring activities, remediation of subsidence impacts, exploration, development of service boreholes, site maintenance activities and other minor ancillary works. This surface disturbance would be temporary and isolated in nature. The surface disturbance would occur progressively and these areas would be rehabilitated when no longer required.

Planning Approval Process

Maxwell Ventures (Management) Pty Ltd, a wholly owned subsidiary of Malabar, is seeking consent for the Maxwell Project under the State Significant Development (SSD) provisions of Part 4 of the NSW *Environmental Planning and Assessment Act, 1979* (EP&A Act) and the NSW *Environmental Planning and Assessment Regulation, 2000*. An Environmental Impact Statement will be prepared to accompany the Development Application for the Maxwell Project.

4.0 The Study Area

The study area for this assessment encompasses the proposed underground mining area, inclusive of a potential impact zone buffer, as well as land required for surface infrastructure (Figure 1). Combined, these areas produce a study area of c. 3,200 ha that extends south of the existing Maxwell Infrastructure as a thin transport corridor, expanding to a roughly circular area south of the Saddlers Creek and north of the Hunter River. The majority of land within the study area is currently, and has historically, been used for grazing.

5.0 Archaeological Context

AHIMS Database

Searches of the AHIMS database were undertaken on 11 May 2018 for a 20 x 20 km area surrounding the study area resulting in the identification of 1,620 Aboriginal sites, comprising 1,593 open artefact sites (i.e., isolated artefacts and artefact scatters) (18 of which have associated areas of Potential Archaeological Deposit [PAD]), 15 modified trees (two with associated artefacts), five grinding groove sites, four stone quarries, one area of PAD, one midden and one burial (Table 1).

Consideration of the location of previously recorded Aboriginal sites indicates that 298 are located wholly or partially within the current study area comprising 293 open artefact sites, two modified trees, two stone quarries and one grinding groove site. From these sites, it is noted that the two modified tree sites (AHIMS#37-2-1945 and 37-2-1944) were assessed by Registered Aboriginal Parties (RAPs) and an arborist as not Aboriginal sites as part of the Drayton South Coal Project (AECOM 2012). It is also noted that stone quarry site 'SC-QS-1/Quarry' (AHIMS#37-2-1955) recorded by Mills (2000) within the study area was not located during AECOM's (2012) assessment despite several attempts. Taking into account the above issues, a total of 295 Aboriginal sites are recognised as being located wholly or partially within the study area (Table 2). These include 293 open artefact sites, one stone quarry and one grinding groove site. Of these, 19 sites are located wholly or partially within proposed surface infrastructure areas, all of which are open artefact sites, and 198 sites, comprising 197 open artefact sites and one stone quarry located directly above the proposed underground mining area.

Table 1 Site search results (20 x 20 km area)

Site Type	Count	%
Open artefact site (i.e., isolated artefacts and artefact scatters)	1575	97.2
Open artefact site with PAD	18	1.1
Modified tree	13	0.8
Modified trees + artefact	2	0.1
Grinding groove	5	0.3
Stone quarries	4	0.2
PAD	1	0.1
Midden	1	0.1
Burial	1	0.1
Total	1620	100

Table 2 Sites within the study area

Site Type	Count	%
Open artefact site (i.e., isolated artefacts and artefact scatters)	293	99.4
Stone quarries	1	0.3
Grinding groove	1	0.3
Total	295	100

Previous Aboriginal Heritage Assessments

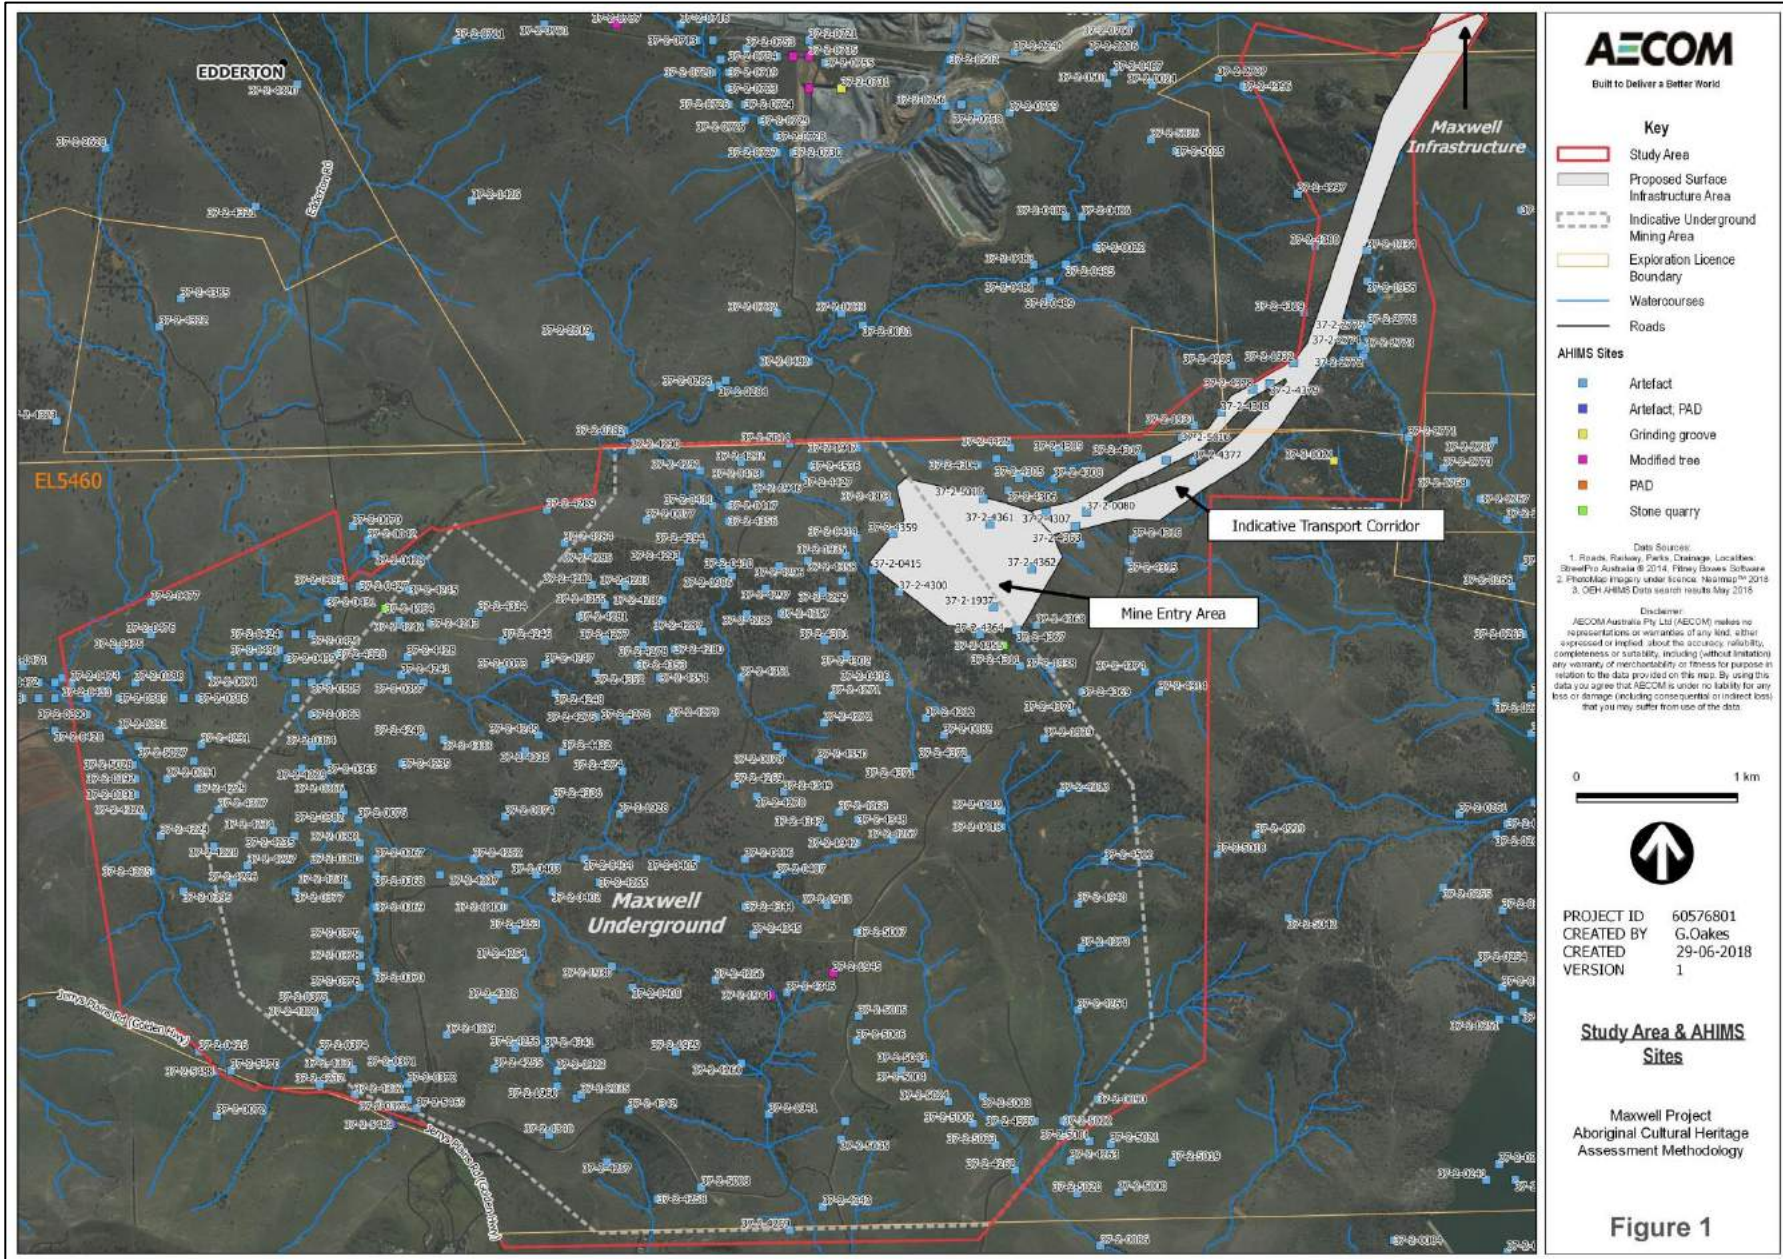

In addition to AECOM's assessments for the Drayton South Coal Project discussed in Section 2.0, Table 3 provides a summary of previous Aboriginal archaeological assessments that have been carried out within the study area.

Table 3 Previous Aboriginal Heritage Assessments

Consultant	Year	Project / Location	Assessment type	Summary of results
L.K. Dyall	1980	Drayton Coal Lease	Survey	Dyall (1980a) undertook a survey of an area immediately south of the Bayswater Colliery and north of the study area within the Maxwell Infrastructure area. Three sites, all artefact scatters, were recorded on the banks of Saddlers Creek. The sites contained flakes, cores and backed blades of chert, rhyolite (tuff) and quartz.
Koettig & Hughes	(1985b)	Plashett Dam, Mount Arthur North, and Mount Arthur South	Survey & excavation	<p>Koettig & Hughes (1985) undertook an archaeological survey of three separate development areas in the Hunter Valley. The areas included the Plashett Dam site and water storage area on Saltwater Creek; a coal mine development on Mt Arthur North; and a coal mine development on Mt Arthur South (Drayton South).</p> <p>Within the Plashett Dam area, a total of 86 open campsites consisting of stone artefacts scatters were recorded. The sites were concentrated along creeklines, especially Saltwater Creek, with artefacts recorded on bare, eroded exposures. Six of these sites were excavated.</p> <p>Within the Mt Arthur South study area a total of 136 archaeological sites were located and recorded. These comprised 135 open campsites with stone artefact scatters and one site consisting of grinding grooves. The survey focused on areas adjacent to Saddlers Creek. Artefact scatters were the most common site type identified during the survey and were identified eroding out of the A soil horizon. The general pattern of site distribution was one of higher numbers of sites along major creeklines i.e. Saltwater Creek, with numbers decreasing along tributaries. Artefact densities along the whole of Saddlers Creek were typified by sites of high average densities, with a marked increase in the lower section of the creek. Indurated mudstone/tuff and silcrete were the most frequently recorded raw material.</p> <p>Survey of the Mt Arthur North area resulted in the locating of 93 open campsites consisting of stone artefact scatters. A programme of excavation and collection was carried out. The survey focused on areas adjacent to Whites Creek. Koettig and Hughes (1985) noted that sites tended to correspond in area to the surface exposures in which they were identified. Very few sites were recorded on hill slopes, ridges or along the upper portions of some creeklines where there were large areas of eroded ground.</p> <p>Consents to Destroy were granted by the National Parks and Wildlife Service for sites at Plashett Dam and Mt Arthur South. A salvage program of excavation and collection work was carried out and artefacts from eight sites were subsequently collected (MAS12, MAS21, MAS24, MAS39, MAS44, MAS46, MAS47 and MAS48). Artefacts recorded during excavations in all three development areas occurred within the lower portion of the A soil horizon. Indurated mudstone/tuff, silcrete and porcellanite were the most common material in the assemblage. All artefacts were assessed as belonging to Phase I Bondaian.</p>
Mills	2000	Saddlers Creek Mine	Survey	Mills (2000) undertook an archaeological survey to identify Aboriginal sites, and areas of potential archaeological sensitivity within the proposed mine and haul road areas for the Saddlers Creek Mine. The focus of the survey was Saddlers Creek; however, a number of its tributaries were also surveyed. Forty Aboriginal sites were identified, including seven isolated artefacts, 29 artefact scatters (nine with

Consultant	Year	Project / Location	Assessment type	Summary of results
				<p>PAD), two quarry sites, and two scarred trees. The majority of artefact scatters and isolated finds were identified along ephemeral feeder creeks of Saddlers Creek. Mills (2000) found evidence of Aboriginal activity was associated with the full length of these creeklines from their headwaters to the floodplain. In addition, at least two sites were identified on ridges and. eight sites were identified at least 200 m from creeklines.</p> <p>A total of 238 artefacts were recorded, including 127 (53.4%) flakes, 41 (17.2%) block fracture fragments, 28 (11.8%) cores, 19 (8%) flake fragments, seven (2.9%) scrapers, five (2.1%) manuports, four (1.7%) hammerstones, three (1.3%) backed blades, one sharpening stone, one millstone, one anvil and one pebble axe. Indurated mudstone/tuff was the dominant material (48.32%), followed by silcrete (31.51%), quartzite (5.46%), chert (5.04%), quartz (2.94%), porcellanite (2.10%), siltstone (2.10%), sandstone (0.84%), basalt (0.84%), fossilised wood (0.42%), and glass (0.42%).</p>
HLA Envirosciences	2002	Drayton Mine Extension	Survey	HLA Envirosciences (2002) completed an archaeological survey for the Drayton Mine extension. A total of 14 artefact scatters were located during survey. Indurated mudstone/tuff was the dominant material (51%), followed by silcrete (39%), quartz (5%) and porcellanite (5%). Artefacts comprised flakes (49%), flaked pieces (41%), cores (9%), and backed blades (1%). All sites were located along creeklines, ridgelines or crests.
Archaeological Risk Assessment Services	2006	Drayton Mine Extension	Survey	ARAS (2006) undertook an assessment for the Drayton Mine extension. A total of 480 stone artefacts were recorded from 39 sites that were identified, comprising of 22 artefact scatters and 17 isolated finds. A large proportion of the sites contained less than 10 artefacts, though five sites had over 50 artefacts and were associated with drainage lines or gullies. Of the 480 artefacts identified, 38% were complete flakes, 31% broken flakes, 26% flaked pieces and 5% cores. A majority of artefacts were of indurated mudstone/tuff (55%), followed by silcrete (25%), porcellanite (14%) and quartz (4.6%).
Archaeological Risk Assessment Services	2010	Drayton Mine Extension	Survey and salvage	ARAS (2010) undertook a program of salvage excavation for 26 Aboriginal sites for the Drayton Mine Extension Project. The salvage included surface collection of artefacts at 22 sites, mechanical grader scrapes at 11 locations and hand excavation at three locations. A total of 8505 artefacts were recovered as part of the works. Of these, 7500 artefacts were recovered from three distinct knapping locations at Ramrod Creek, identifying the creek as archaeologically sensitive. OSL (optically stimulated luminescence) dating of deposits at Ramrod Creek and Delpah returned dates of 3-1.4 ka years ago placing them in the Late Holocene. Raw materials utilised included porcellanite, silcrete, tuff and chert. At Ramrod Creek, porcellanite was the dominant raw material, while at Delpah, silcrete and tuff were dominant. ARAS (2010) proposed two main site types, reflecting two differing site functions, were present within the study area: fringe sites representing short-term occupation, and sites principally focused on the manufacture of backed artefacts. On the basis of site size (i.e. number of artefacts) and the ratio of discarded tools to waste material, ARAS (2010) proposed that sites adjacent to ridgelines and overlooking ephemeral water systems were the result of 'short term settlement'. Conversely, ARAS (2010) found sites associated with Ramrod Creek were specific to stone tool manufacturing activities, with particular emphasis on producing Bondi points from porcellanite.

Figure 2 Study area and AHIMS sites

6.0 Methodology

The approach that AECOM intends to adopt for undertaking the current assessment includes the following key components:

1. Background research;
2. Archaeological survey of those areas within the study area not previously surveyed (i.e., as presented in AECOM [2012, 2015]) and potentially impacted by the project;
3. Consultation with RAPs in order to identify the Aboriginal cultural heritage values of the study area; and
4. Preparation of an ACHA for the study area detailing the results of the above. Appropriate management/mitigation measures for the identified Aboriginal heritage values of the study area will be provided in this report.

The proposed methodologies for each of these components are detailed in the sections below.

The roles, responsibilities and functions of the RAPs, AECOM (Proponent's representative) and Maxwell Ventures (Management) Pty Ltd (the Proponent) are outlined in Attachment 1.

A. Background Research

The following tasks will be undertaken for the background research component of the assessment:

- Updated searches of OEH's AHIMS database;
- A review associated site cards and reports to clarify site contents, extents and statuses;
- A review of the landscape context of the study area, with a particular emphasis on its implications for the nature and distribution of Aboriginal archaeological materials;
- A review of relevant archaeological and ethnohistoric information for the study area and environs; and
- Preparation of a predictive model for the Aboriginal archaeological record of the study area.

B. Archaeological Survey

AECOM proposes to utilise the survey results from AECOM (2012, 2015) and only undertake survey within those portions of the Maxwell Project study area not previously surveyed (gap areas). In addition, archaeological survey will only be undertaken in those areas potentially subjected to direct and indirect project related impacts. As such, archaeological survey may not be required for the entire study area. The requirement for archaeological survey will be assessed on an ongoing basis as mine plans progress.

Survey will be undertaken by a combined field team of two AECOM archaeologists and appropriate number of RAP field representatives, as determined by AECOM and Malabar Coal Limited prior to survey. While vehicles may be used to transport the survey team between survey localities, all survey will be completed on foot. Linear transects of variable length and width, depending on ground conditions and occupational health and safety (OH&S) considerations are proposed. The location of all transects completed during survey, including their start and end points, will be recorded using one of two handheld differential GPS units, with associated transect data (e.g., levels of visibility and exposure, disturbance factors) entered directly into the same unit upon the completion of each transect.

All Aboriginal archaeological sites identified during the survey will be recorded to the standard required by the *Code of Practice for Archaeological Investigation of Aboriginal Objects in NSW* (DECCW 2010b). For each site located or re-visited, individual artefact locations will be captured by differential GPS. As with that recorded for individual survey transects, attribute data for all identified flaked stone artefacts will be entered directly into a GPS unit using AECOM's standard digital open site recording form. All sites will be comprehensively photographed following artefact recording and registered on OEH's AHIMS database.

Modifications to the study area may occur during the preparation of the ACHA as detailed mine planning progresses. In addition, modifications to the proposed methodology may occur in response to survey results, feedback from RAPs or other unanticipated events.

C. Cultural Values

RAP representatives are in the best position to provide information on the Aboriginal social/cultural heritage values of a given area. During the assessment process, AECOM archaeologists will consult with RAPs regarding the cultural heritage values of objects and places in the study area. This will include:

- A request (with this draft methodology) for any initial comments regarding the Aboriginal cultural heritage values of the study area;
- The provision of this information package, including draft assessment methodology to all RAPs for comment prior to fieldwork;
- RAP participation in field survey;
- Discussion of cultural heritage values with RAPs during field survey and generally throughout the process until the end of the draft ACHA review period; and
- Provision of draft ACHA to all RAPs for comment prior to finalisation.

The identification of cultural values will include places of social, spiritual and cultural value, historic places with cultural significance, and potential places/areas of historic, social, spiritual and/or cultural significance.

As noted in OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents 2010* (DECCW, 2010a), some information obtained from registered Aboriginal parties may be sensitive or have restricted public access. AECOM, in consultation with relevant RAPs, will develop appropriate protocols for sensitive or restricted information, including:

1. Cultural restrictions on access to the material.
2. Cultural restrictions on communication of the material.
3. Cultural restrictions on the location of the material.
4. Cultural recommendations on handling the material.
5. Any other contextual information.
6. The names and contact details of persons authorised within the relevant Aboriginal group to make decisions concerning the Aboriginal material and the degree of authorisation.
7. Details of any consent given in accordance with customary law.
8. Level of confidentiality to be accorded to the material.
9. Access and use, by the registered Aboriginal parties, of the cultural information in the material.

It is also noted that the purpose of community consultation with Aboriginal people is to assist AECOM and Malabar in the preparation of an application for an Aboriginal Heritage Impact Permit (although such a permit is not expected to be necessary given the Project will be assessed as an SSD [Section 3]), and to assist the "Director-General" (DECCW, 2010) in his or her consideration and determination of the application.

D. Preparation of an ACHA

AECOM will prepare an ACHA for the Project detailing the results of the above archaeological survey and consultation with RAPs. The ACHA will provide appropriate management and mitigation measures for the study area's Aboriginal heritage values. RAPs will have the opportunity to comment on management and mitigation options proposed in the ACHA prior to finalisation.

Archaeological Test Excavation

It is noted that none of the Aboriginal sites selected for archaeological test excavation as part of the Drayton South Project are located within the Maxwell Project surface disturbance areas. As such, archaeological test excavation is not currently proposed as part of the ACHA. However, should Aboriginal sites be identified within gap areas during the assessment and it be determined that test excavation is required to better understand the nature, extent and significance of these sites, then it would be considered as part of the ACHA. Should archaeological salvage be required, this would be

recommended to be undertaken post-approval with details included in an Aboriginal Cultural Heritage Management Plan (ACHMP) prepared for the project.

7.0 Project Timeline

Current proposed timelines for the ACHA are:

- Collation of culturally significant information – ongoing throughout process until the end of the draft ACHA review period.
- Meeting with RAPs to present information about the Maxwell Project and discuss this draft methodology – 10 August 2018.
- Provision of comment on this draft methodology – 21 August 2018.
- Field surveys – late August/early September 2018.
- Provision of a draft ACHA report to each RAP for review and comment – anticipated to occur in late 2018.
- Period for comment on the draft ACHA report – a minimum of 28 days following provision of the draft report.
- Preparation of a final ACHA report in consideration of comments received – anticipated to occur in early 2019.

The above timelines are preliminary only and are subject to change. RAPs will be notified of dates for field surveys and the due date for provision of comments on the draft ACHA report once available.

Attachment 1 – Roles, Responsibilities and Functions (NSW Department of Environment Climate Change & Water 2010a pp.15-17).

5 Roles, responsibilities and functions

For the consultation process to be effective, all parties must appreciate and respect each other's perspective and understand each other's interests, roles and responsibilities.

5.1 Department of Environment, Climate Change and Water

The Director General of DECCW is the decision-maker who decides whether to grant or refuse an AHIP application. If an AHIP is issued, conditions are usually attached and DECCW is responsible for ensuring the AHIP holder complies with those conditions. When considering an application under Part 6 of the NPW Act, the Director General will review the information provided by proponents in line with its internal policies and procedures to assess potential or actual harm to Aboriginal objects or places (DECCW, 2009).

The Environment Protection and Regulation Group (EPRG) of DECCW is responsible for administering the regulatory functions under Part 6 of the NPW Act. A map and list of DECCW EPRG regional offices is in Appendix A.

DECCW expects proponents and Aboriginal people should:

- be aware that Part 6 of the NPW Act establishes the Director General or delegate of DECCW as the decision-maker
- recognise that the Director General's (or delegates) decisions may not be consistent with the views of the Aboriginal community and/or the proponent. However, DECCW will take into account all relevant information it receives as part of its decision-making process.

Further information about the structure of DECCW, and the roles and responsibilities of various groups and the services provided, such as EPRG, Culture and Heritage Division (CHD), and Parks and Wildlife Group (PWG) can be found at: www.environment.nsw.gov.au/whoweare/planorgs.htm

5.2 Registered Aboriginal parties

The interests and obligations of Aboriginal people relate to the protection of Aboriginal cultural heritage. It is only Aboriginal people who can determine who is accepted by their community as being authorised to speak for Country and its associated cultural heritage. Where there is a dispute about who speaks for Country, it is appropriate for Aboriginal people, not DECCW or the proponent, to resolve this dispute in a timely manner to enable effective consultation to proceed.

It is expected that DECCW, proponents and service providers that act on their behalf should:

- display a meaningful appreciation, understanding and respect for the belief system, spiritual connection and sense of belonging that Aboriginal people have to their land, people and environment, which includes plants, animals, waterways, sacred sites and other places of cultural significance and importance
- uphold and respect the traditional rights, obligations and responsibilities of Aboriginal people who hold cultural knowledge in accordance with traditional lore and custom, particularly as these relate to the cultural business of men and women
- encourage active participation of culturally experienced and appropriate Aboriginal people who hold cultural knowledge in the consultation process
- encourage opportunities for the effective transfer of cultural knowledge from older to younger generations in accordance with traditional lore and custom through the consultation process
- have an awareness and understanding of how colonisation has impacted the Aboriginal people of Australia

- have an understanding and respect for the lore and customs, cultural practices, responsibilities and obligations that Aboriginal people have toward the continued care and conservation of Aboriginal objects and places.

Aboriginal people should:

- have an awareness and understanding of the commercial environment and constraints in which proponents operate
- develop and display an awareness and understanding of the opportunities to input into regulatory processes to contribute to decision making by proponents and government authorities.

5.2.1 NSW Aboriginal Land Council and Local Aboriginal Land Councils

The NSW Aboriginal Land Council (NSWALC) and Local Aboriginal Land Councils (LALCs) have statutory functions relevant to the protection of Aboriginal culture and heritage under the *NSW Aboriginal Land Rights Act 1983*. These requirements do not extend the role of NSWALC and LALCs in the significance assessment process. That is, these requirements do not provide NSWALC and/or LALCs any additional or specific decision-making role in the assessment of significance of Aboriginal object(s) and/or place(s) that are subject to an AHIP application under Part 6 of the NPW Act.

LALCs may choose to register an interest to be involved in the consultation process, or may assist registered Aboriginal parties to participate in the consultation process established by these requirements. In order to ensure effective consultation and the subsequent informed heritage assessment, LALCs are encouraged to identify and make contact with Aboriginal people who hold cultural knowledge in their area.

For further information on LALCs and the role they can play in these requirements, see DECCWs *Fact sheet 4: Local Aboriginal Land Councils*.

5.3 Proponents

Proponents operate within a commercial environment which includes:

- financial and management issues, priorities and deadlines
- the need to obtain broad community support and acceptance in order to secure any necessary approval/consent/licence/permit to operate
- the desire for clearer processes and certainty of outcomes
- the need for suitable access to land for the purpose of their development project
- a need to work efficiently within the project's time, quality and cost planning and management parameters
- the need for culturally appropriate assessment findings relevant to their project.

Under these requirements, proponents should:

- bring the registered Aboriginal parties or their nominated representatives together and be responsible for ensuring appropriate administration and management of the consultation process
- consider the cultural perspectives, views, knowledge and advice of the registered Aboriginal parties involved in the consultation process in assessing cultural significance and developing any heritage management outcomes for Aboriginal object(s) and/or place(s)
- provide evidence to DECCW of consultation by including information relevant to the cultural perspectives, views, knowledge and advice provided by the registered Aboriginal parties
- accurately record and clearly articulate all consultation findings in the final cultural heritage assessment report

- provide copies of their cultural heritage assessment report to the registered Aboriginal parties who have been consulted
- submit an application to DECCW for an AHIP in a timely manner and with all required information.

Importance: High

Dear Georgie,

- **Proposed methodology for Maxwell Project Rejected by Registered Native title party Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People**

Further to the response from the registered Native title party the PCWP, I have further reviewed the attached Methodology for the project and confirm that we do not except the Methodology for the proposed assessment. This document attempt to heighten the need to comply with the current CCGL 2010 but clearly leaves out significant section of the same document. It appears to draw on a conclusion but exclude requirement under the CCGL 2010, further to this the current position with the registration of interest is at a stage where the company has not even vetted the registered interested parties under the consultation guild lines, with regard to the below the only party that meets this section is; (see Below) the below grounds are why we do not support the proposed methodology for the Maxwell project, we also request that you contact OEH today and advise them that we do not support the methodology.

The Methodology in known way considers the below section, the methodology also has not recorded or appears to not even consider the Assessment conducted and completed by.

- Peter Kuskie south east Archaeology.
- Planning Assessment commission ruling.
- Upper hunter breeders / Tocomwall response to the Pac.(GML)

I would also like to advise that the mine itself have also advised me that the current MLA's for Spur Hill are being withdrawn based on the map provided with your document page 3 provides a map for the survey that covers the right to negotiate issues for section 29 Spur Hill, I now believe that the survey could not be conducted as with the MLA's being withdrew there is no approval in place that requires a survey of our heritage for possible destruction.

- Scott Franks and Anor on behalf of the Plains Clans of the Wonnarua People
- http://www.nntt.gov.au/searchRegApps/NativeTitleRegisters/Pages/RNTC_details.aspx?NNTT_FileNo=NC2013/006

Section 3

3.3.1 Who can provide this information?

Aboriginal people who can provide the information outlined in 3.3 above are, based on Aboriginal lore and custom, the traditional owners or custodians of the land that is the subject of the proposed project. Traditional owners or custodians with appropriate cultural heritage knowledge to inform decision making who seek to register their interest as an Aboriginal party are those people who:

- · continue to maintain a deep respect for their ancestral belief system, traditional lore and custom
- · recognise their responsibilities and obligations to protect and conserve their culture and heritage and care for their traditional lands or Country
- · have the trust of their community, knowledge and understanding of their culture, and permission to speak about it.

In some cases, the information required for decision making will be held by Aboriginal people with statutory recognition for certain lands:

- · Aboriginal owners in accordance with the NSW ALR Act and/or
- · Native title holders or registered native title claimants in accordance with the *Native Title Act 1993* (Cth) and NSW *Native Title Act 1994*

It is acknowledged that Aboriginal people who, through a historical presence in a particular area, may have developed cultural knowledge relevant to the Aboriginal objects and/or places based on knowledge passed down to them by Aboriginal people with a traditional connection to Country. DECCW respects the rights of Aboriginal people with a historical connection to Country to, with their permission, act on behalf of Aboriginal people with a traditional connection to Country. DECCW acknowledges that in some cases it will only be Aboriginal people with a historical connection to an area who have the knowledge to inform the assessment of cultural significance of certain objects/places; e.g. on Aboriginal reserves and missions.

All correspondence received at our end suggest that the RAPS have been taken on face value and know attempt to comply with section 3 of the CCGL 2010 has been considered let alone section 90k. the groups that have registered an interest are not authorised to make comments, recommendations or support the destruction of any area with in the Registered Native title area of the PCWP. I would also like to confirm that Tocomwall and the PCWP do not support the methodology provided to us and the Raps at know stage has the company attempted to address our concerns, As advised in the consultation guild lines if Raps have differing views on a methodology a independent mediation process must be sort.

The registered Native title party are known requesting mediation for this project and we seek OEH's intervention to seek a stop work agreement on the current proposed field survey until a mediated out comes has been reached.

Section Q5 facts sheet attached to CCGL 2010.

What happens when the views of registered Aboriginal parties differ markedly? That is, some may support a proposed development and AHIP application while others may oppose it. How do conflicts of views get resolved?

The proponent is required to record all feedback received, along with the proponent's response to the feedback. The proponent should make reasonable attempts to resolve conflicts; however, DECCW acknowledges that, in some cases, this may not be achievable.

In the case where conflict cannot be resolved, it is the responsibility of the proponent to record these differences and provide the necessary information in their Aboriginal cultural heritage assessment report with their AHIP application to support decision making.

Conflict resolution is a component of consultation – DECCW recommends that proponents engage someone who is skilled and experienced in consultation with Aboriginal people.

Cced,

- OEH
- Department of industry

Importance: High

Geordie,

Thank you for the attached document regarding the Maxwell Project, I would like to advise this mining lease currently have an outstanding Section 29 RTN with the registered Native title party, and as such the registered Native title party cannot support the proposed methodology you have applied to use for the project. The attempt to engage with registered Aboriginal parties and then simply except those people as being Traditional knowledge holders for that area is in oppositions to the current CCGL 2010. One element of your document fails to address section 3 and also page 5 of the (following link for your information)

Page 5 of OEH 2010 Guide to investigating, assessing and reporting on Aboriginal cultural heritage in NSW contains the reference that you referred to. Document is available at:

<http://www.environment.nsw.gov.au/resources/cultureheritage/20110263ACHguide.pdf>

Skills to investigate and assess Aboriginal cultural heritage

The investigation and assessment of Aboriginal cultural heritage should make use of all relevant disciplines. The assessment of cultural significance is more than a component of an archaeological assessment or investigation. It cannot be assumed that any one practitioner will have the full range of skills required to investigate and assess cultural significance and harm. During this task it may be necessary to engage additional practitioners with special expertise.

I would also like to point out the Registered Native title have made it quite clear in our registration of interest for this project that we do not and have never gave permission or authorised any Registered Aboriginals party to speak for or on the behalf of our native title claimed area or interpret the importance of our heritage. As you are aware this registered Claim group conduct our own cultural heritage assessment for the purpose of assessing our lands for the possible approval of developments with the claimed area.

I have also noticed that your review has left out the heritage assessment managed by resource strategies and south east archaeology.

Regards
Scott Franks

Subject: Re: Maxwell Project Aboriginal Cultural Heritage Assessment Report (ACHAR)

Importance: High

Dear Georgie,

Thank you for the Maxwell Project Aboriginal Cultural Heritage Assessment Report (ACHAR). Tocomwall and the PCWP registered native title claimant group rejects the ACHAR. After a quick review of the document it appears that you or the proponent has not considered the finding against this mining lease before it was purchased by Maxwell. The PAC rejected the original heritage assessment conducted by AECOM and supported the confidential assessment conducted by Tocomwall and the upper hunters breeders association. As this document is controlled by The upper hunters Breeders association and Tocomwall, I will not be making that available to AECOM or your proponent.

As the reregistered Native title claimant for the Scott Franks and anor, I request a meeting with Department of planning and OEH to discuss our concern with this project going ahead.

Regards
Scott Franks

BY EMAIL: scott@tocomwall.com.au

Dear Mr Franks,

Maxwell Project – Comments from Tocomwall In Relation to Draft Aboriginal Cultural Heritage Assessment Report

Thank you for your email of 18 November 2018, to which I refer.

I would like to note that as the author of the Aboriginal cultural heritage assessment for the Drayton South Project, I am aware that a confidential submission was made by Tocomwall regarding Aboriginal cultural heritage matters for that project. As part of the gathering of cultural values information for the Maxwell Project, I would like to request that should you have any cultural values you would like included in the Maxwell Project ACHAR, including those contained within the confidential submission, that you please provide those by mail, fax or email for inclusion in the assessment.

I note that you indicated, in your email of 18 November 2018, that you had undertaken a "quick review" of the draft Aboriginal cultural heritage assessment report. It would be appreciated if you could please conduct a full review of the draft report and, if you still remain of the view that the draft report is inadequate in addressing the substance of the confidential report, I would invite you to either:

- (a) meet with me for the purpose of you explaining to me how you suggest the concerns raised by the confidential report are best addressed; or
- (b) provide me with written correspondence which explains to me how you consider the concerns raised by the confidential report are best addressed.

I would appreciate your response in this regard by no later than 18 January 2019.

The proponent of the Maxwell Project, Malabar Coal, has indicated to me that they are prepared to cooperate with you to address the concerns raised in the confidential report.

I also note that you made reference to conclusions by the Drayton South PAC in relation to the previous assessment report. I have included the conclusions of the relevant PAC reports in an enclosure to this letter for your reference.

I look forward to hearing from you soon.

Yours faithfully

Geordie Oakes
Senior Heritage Specialist

ENCLOSURE 1 – REVIEW OF PREVIOUS PAC REPORTS

Drayton South Coal Project – PAC Review Report (dated December 2013) (First PAC Review Report)

In the First PAC Review Report, the issue of Aboriginal cultural heritage was not discussed in any detail. Rather, on p 22 of the First PAC Review Report, it was stated:

Other impacts

Other impacts of the proposed mine have not been discussed in this report as they were not considered critical to the assessment of the impact on the horse studs. Nonetheless these would need to be considered prior to any determination and include Aboriginal cultural heritage, climate change and traffic impacts.

Drayton South Coal Project – PAC Determination Report (dated 17 October 2014) (First PAC Determination Report)

In the First PAC Determination Report, the issue of Aboriginal cultural heritage was not expressly discussed in it. There, was, however, reference to heritage generally, which may be construed as including Aboriginal cultural heritage, in the following paragraph on p 3 of the First PAC Determination Report:

Other potential impacts such as biodiversity, heritage, water, economic and social, are unlikely to be significant and can be suitably mitigated and/or offset.

Drayton South Open Cut Coal Project – PAC Review Report (dated November 2015) (Second PAC Review Report)

In the Second PAC Review Report, the PAC identified that the proponent's Aboriginal cultural heritage assessment had considered tangible Aboriginal artefacts, but comparatively limited attention had been given to "the wider, less tangible, cultural landscape and context provided by the Aboriginal cultural heritage values associated with the area" (p 59 of the Second PAC Review Report). The PAC recommended that further Aboriginal cultural heritage assessment work be undertaken in connection with the proposed project, but did not "reject" the Aboriginal cultural heritage assessment report that had been undertaken.

Drayton South Open Cut Coal Project – PAC Determination Report (dated 22 February 2017) (Second PAC Determination Report)

In the Second PAC Determination Report, the PAC expressly addressed a confidential submission. On p 22 of the Second PAC Determination Report, it is relevantly stated:

The Commission received submissions, including a confidential report, raising concerns with the assessment of indigenous cultural heritage issues within the Project site ...

Furthermore, the confidential report noted that the Applicant's Indigenous cultural heritage report did not consider the value of, or impacts to, 25 of the 27 cultural heritage aspects that were identified in the confidential report. The key finding of the confidential report was that the Applicant's report does not represent an accurate, comprehensive and adequate assessment of indigenous heritage values, or assessment of the heritage impact to those values.

The Commission acknowledges that the Project could result in impacts on indigenous cultural heritage. However, the Commission, on review of the information submitted by the Applicant, OEH and in submissions, is satisfied that the Applicant has adequately addressed the concerns raised, noting that the approach to excavations proposed is consistent with that advocated by OEH and with the guidelines relevant to indigenous heritage assessment.

On this basis, the Commission finds that the Project would, subject to the mitigation measures proposed by the Applicant and the conditions recommended by the Department, have an acceptable impact on indigenous cultural heritage

Subject: Re: Maxwell Project Aboriginal Cultural Heritage Assessment Report (ACHAR)

Importance: High

Dear Georgie,

Thank you for the phone call and the follow up issue regarding the Maxwell mining operation. As I have explained in the past Tocomwall with a licence and consent of the registered Native title party PCWP do not except or give permission to Registered Aboriginals party's assessing or making comment on the cultural values with in the registered native title clamed area. As you would be aware in September 2018 Tocomwall lodged several sites cards with AHMIS one of which covers the Maxwell mining operation's ELA, the company in question is very familiar with the registered native title part as per a section 29 notice that was attached to the previous approval before the MLA was withdrawn.

As the company has been involved in a section 29 notification under native title it is ridiculous for this company to now try and refuse to except who and which group is a traditional knowledge holder as described in the 2010 CCGL for proponents. To allow people to asses our country and to make decisions on our cultural lore and customs is appalling. This being said with regard to the sites card for that location and the confidential assessment conducted by Tocomwall and the upper hunters breeders association. As this document is controlled by The upper hunters Breeders association, Tocomwall will be using this information direct with OEH and the federal Government to lodge a section 9 and section 10 applications under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984 (Cth) (the ATSIHP Act). Tocomwall would further like to state that this company has known issue with the work AECOM are conduction but we take exception to the way Maxwell are side stepping issues we have raised with you and OEH.

Geordie,

Sorry for the delay, Cacatua and AGA Services had our last meeting for the year this morning via phone link up, In our meeting we tabled the information that was supplied with regards to Maxwell Project.

Both AGA Services and Cacatua agree and support the Aboriginal Cultural Heritage Assessment Report that was supplied.

Thank you
George

Subject: Re: FW: Maxwell Project Aboriginal Cultural Heritage Assessment Report (ACHAR)

Good Afternoon Geordie,

Culturally Aware has viewed your Report and happy with the mitigation methods and proposed recommendation for each site of the area.

Further consultation with the Aboriginal community and being kept up to date with these recommendations to where they are up to with permits , community input and involvement.

As for the Plan of management the Aboriginal Community should assist with this so that Heritage management plan can be developed according to the individual requirements of particular sites of the Cultural landscape(Flats, Mid Slopes, crest, and in particular the water courses) as some areas may already show signs of natural erosion etc, so mitigation methods should be a separate process depending on the extent of erosion/Cracking of each site therefore monitoring and stabilisation of areas should be taken into account to stop the site being lost from Natural impacts or possible cracking .

All relevant stakeholders should be involved in the formulation and execution of management plans to preserve and protect a site from damage while having as little impact to the integrity of the site as possible and trying to maintain its natural surrounds as they are (e.g Water flows) that are integral to the significance of the place.

The cultural landscape is of high importance to the Aboriginal people, it's a part of our cultural connection especially a majority of this Landscape as it tells a cultural story to us, and shows how all the sensitive cultural landscape surrounding this area all merge together to be part of a bigger picture .

Looking forward to future consultation on this Assessment.

Thanks
Tracey Skene

Dear RAP,

In accordance with Section 4.4.2 of OEH's *Aboriginal Cultural Heritage Consultation Requirements for Proponents* (DECCW 2010), please find attached for your review a draft of AECOM's Aboriginal Cultural Heritage Assessment Report (ACHAR) as well as an associated information letter for the Maxwell Project, a proposed underground coal mine, located to the east-southeast of Denman and south-southwest of Muswellbrook, within the local government area of Muswellbrook, NSW.

Should you have any cultural values or comments you would like included in the ACHAR please provide those by mail, fax, e-mail or phone to Georgie Oakes via the contact details on this email. Please note that the closing date for comments is Tuesday 18 December 2018.

If you would like a hard copy (paper version) of the assessment report, please let me know.

All the best,
Geordie

19/07/2018	Methodology sent to RAPs			
25/07/2018	PCWP	Scott Franks	Phone	Has issues with consultation process. PCWP should be the only RAP. Study Area contains Spur Hill Project area which has a Section 29 over it.
25/07/2018	PCWP	Scott Franks	Email	Has issues with methodology. Advises "this mining lease currently have an outstanding Section 29 RTN with the registered Native title party, and as such the registered Native title party cannot support the proposed methodology you have applied to use for the project. The attempt to engage with registered Aboriginal parties and then simply except those people as being Traditional knowledge holders for that area is in oppositions to the current CCGL 2010. One element of your document fails to address section 3 and also page 5 of the (following link for your information"
30/07/2018	Wallagan Cultural Services	Maree Waugh	Email	Agrees with methodology + insurances
6/08/2018	PCWP	Scott Franks	Phone	GO called Scott to discuss PCWP requirements for cultural values assessment. Was informed that cultural mapping was required as the study area

Date	RAP	RAP Representative	Contact	Correspondence/Comments
				was near the Mount Arthur Massacre site and songlines. Also, that there was crown land in the study area and PCWP had the right to negotiate.
8/08/2018	Widescope	Steven Hickey	Email	Agrees with methodology
10/08/2018	ACHAR information session held at Maxwell office			
15/08/2018	Wallagan Cultural Services	Maree Waugh	Phone	Maree called to check that insurances came through.
15/08/2018	Hunter Valley Aboriginal Corporation	Ross Pahuru	Email	Ross emailed to check how long the meeting lasted.
16/08/2018	Kauwul Wonn1	Suzie Worth for Arthur Fletcher	Email	Provided insurances

19/12/2018	Cacatua	George Sampson	Phone	No answer. Left msg.
19/12/2018	Hunter Valley Aboriginal Corporation	Ross Pahuru	Phone	No answer. Left msg.
19/12/2018	Lower Hunter Wonnarua Cultural Services	Tom Miller	Phone	No answer.
21/08/2018	PCWP	Scott Franks	Email	Does not support the methodology.
27/08/2018	Widescope	Steven Hickey	Email	Cannot attend rostered fieldwork days
18/11/2018	Draft ACHAR sent to RAPs			

Date	RAP	RAP Representative	Contact	Correspondence/Comments
28/11/2018	Gidawaa Walang Cultural Heritage Consultancy	Craig Horne	Email	Supports the assessment and recommendations
26/11/2018	Murra Bidgee Mullangari	Ryan Johnson	Email	Supports the assessment and recommendations
21/12/2018	PCWP	Scott Franks	Email	<p>"Tocomwall with a licence and consent of the registered Native title party PCWP do not except or give permission to Registered Aboriginals party's assessing or making comment on the cultural values with in the registered native title clamed area. As you would be aware in September 2018 Tocomwall lodged several sites cards with AHMIS one of which covers the Maxwell mining operation's ELA, the company in question is very familiar with the registered native title part as per a section 29 notice that was attached to the previous approval before the MLA was withdrawn"</p> <p>"As the company has been involved in a section 29 notification under native title it is ridiculous for this company to now try and refuse to except who and which group is a traditional knowledge holder as described in the 2010 CCGL for proponents. To allow people to asses our country and to make decisions on our cultural lore and customs is appalling. This being said with regard to the sites card for that location and the confidential assessment conducted by Tocomwall and the upper hunters breeders association. As this document is controlled by The upper hunters Breeders association, Tocomwall will be using this information direct with OEH and the federal Government to lodge a section 9 and section 10 applications under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984 (Cth) (the ATSIHP Act). Tocomwall would further like to state that this company has known issue with the work AECOM are conduction but we take exception to the way Maxwell are side stepping issues we have raised with you and OEH"</p>
19/12/2018	Ungooroo culture & community service	Rhonda Ward	Email	No comment but wanted to be involved in all decisions and work
19/12/2018	Yinarr Cultural Services	Kathie Steward Kinchela	Phone	No answer.
19/12/2018	Merrigarn	Shaun Carrol	Phone	No answer.
19/12/2018	Muragadi	Jessie Carrol-Johnson	Phone	Disconnected
19/12/2018	Wailwan Aboriginal Digging Group (Phil Boney)	Phil Boney	(Phone not provided)	Email reminder sent about draft ACHAR
19/12/2018	Amanda Hickey Cultural Services	Amanda Hickey	Phone	Wrong number
19/12/2018	A1 Indigenous Services	Carolyn Hickey	Phone	Hasn't had time to review the report. Will do so tonight
19/12/2018	Widescope (Steven Hickey)	Steven Hickey	Phone	Supports the assessment and recommendations
19/12/2018	Kauwul Wonn1	Arthur Fletcher	Phone	Hasn't had time to review the report. Requested report be emailed again
19/12/2018	Gomeroy Cultural Consultants	Dave Horton	Phone	Hasn't received the report. Explained the findings and management recommendations. Dave said he was happy with the recommendations. Requested a hard copy of the report.
20/12/2018	Amanda Hickey Cultural Services	Amanda Hickey	Email	Amanda stated 'AHCS is happy with the draft report'
20/12/2018	Cacatua	George Sampson	Emal	Supports the assessment and recommendations

Date	RAP	RAP Representative	Contact	Correspondence/Comments
20/12/2018	AGA Services	George Sampson	Email	Supports the assessment and recommendations
20/12/2018	Hunter Valley Aboriginal Corporation	Ross Pahuru	Phone	Ross called and stated he no longer works for HVAC and to try contacting them directly.
20/12/2018	Wallagan Cultural Services	Maree Waugh	Phone	Maree called and stated she was happy with the report recommendations
20/12/2018	Culturally Aware	Tracey Skene	Email	Tracey emailed and stated she is happy with the mitigation recommendations in the report. Requests to be kept updated on assessment progress. Also requests community be involved in developing the management plan.
21/12/2018	WLALC	Noel Downs	Phone	Noel called to say he will not get a chance to provide a response until late January. He said he'd like to respond and has some comments around Scott Frank's assertions regarding consultation and around some cultural information he and the LALC have gathered.
27/12/2018	Wailwan Aboriginal Digging Group (Phil Boney)	Phil Boney	Email	No comments on the report
24/01/2019	Aleira French Trading	Aleira French	Email	Happy with the report

Appendix M

Subsidence Assessment Extracts

The building structures, surface infrastructure and improvements on the properties located outside the Study Area are predicted to experience negligible vertical subsidence, tilts, curvatures and strains. It is unlikely that these features would experience adverse impacts due to the proposed mining. All structures, infrastructure and improvements on the private properties are expected to remain in safe and serviceable conditions throughout the mining period.

6.15. Aboriginal heritage sites

6.15.1. Descriptions of the Aboriginal heritage sites

The locations of known Aboriginal heritage sites are shown in Drawing No. MSEC986-25. The details of these sites have been provided by AECOM (2019).

The Aboriginal heritage sites located within the Study Area and surrounds comprise stone quarries and other open artefact sites, i.e. isolated artefacts, artefact scatters and an artefact scatter with an associated potential archaeological deposit (PAD). The locations of these sites relative to the proposed mining areas are provided in Table D.01, in Appendix D. The locations provided in Table D.01 are based on an amalgamation of the sites and estimated extents due to the proximity of neighbouring sites.

Further details on the Aboriginal heritage sites are provided by AECOM (2019).

6.15.2. Predictions for the Aboriginal heritage sites

The maximum predicted total conventional subsidence parameters for each of the Aboriginal heritage sites are provided in Table D.01, in Appendix D. The predictions provided in Table D.01 are based on the maximum values within the amalgamation of the sites and estimated extents.

Summaries of the maximum predicted total vertical subsidence, tilt and curvatures for the stone quarries and the other open artefact sites (i.e. isolated artefacts, isolated artefacts, artefact scatters and artefact scatter with PAD) are provided in Table 6.12 and Table 6.13, respectively.

Table 6.12 Maximum predicted total vertical subsidence, tilt and curvatures for the stone quarries

After completion of seam	Maximum predicted total vertical subsidence (mm)	Maximum predicted total tilt (mm/m)	Maximum predicted total hogging curvature (km ⁻¹)	Maximum predicted total sagging curvature (km ⁻¹)
Whynot	< 20	< 0.5	< 0.01	< 0.01
Woodlands Hill	< 20	< 0.5	< 0.01	< 0.01
Arrowfield	< 20	< 0.5	< 0.01	< 0.01
Bowfield	< 20	< 0.5	< 0.01	< 0.01

Table 6.13 Maximum predicted total vertical subsidence, tilt and curvatures for the other open artefact sites

After completion of seam	Maximum predicted total vertical subsidence (mm)	Maximum predicted total tilt (mm/m)	Maximum predicted total hogging curvature (km ⁻¹)	Maximum predicted total sagging curvature (km ⁻¹)
Whynot	325	15	0.5	1.0
Woodlands Hill	3100	45	2.0	1.5
Arrowfield	4800	50	2.0	2.0
Bowfield	5450	50	2.0	2.0

The previously reported stone quarries within the Study Area and surrounds are predicted to experience less than 20 mm vertical subsidence. Whilst the stone quarries located outside the proposed mining area could experience very low-levels of vertical subsidence, they are not expected to experience measurable tilts, curvatures or strains.

The maximum predicted total conventional curvatures for the other open artefact sites are 2.0 km⁻¹ hogging and sagging, which represent a minimum radius of curvature of 0.5 km. The predicted conventional strains based on applying a factor of 10 to the predicted conventional curvatures are 20 mm/m tensile and compressive.

The distributions of strain above the proposed mining area are provided in Section 4.3. The predicted strains due to the proposed multi-seam mining are 8 mm/m tensile and 9 mm/m compressive based on the 95 % confidence levels.

Non-conventional movements can also occur and have occurred in the NSW coalfields as a result of, amongst other things, anomalous movements. The analysis of strains provided in Chapter 4 includes those resulting from both conventional and non-conventional anomalous movements.

6.15.3. Impact assessments for the Aboriginal heritage sites

The Aboriginal heritage sites are located across the proposed mining area and, therefore, they could experience the range of the predicted mine subsidence movements. These sites can potentially be affected by cracking and heaving of the surface soils due to the proposed mining.

The assessed surface deformations above the proposed panels and longwalls are provided in Section 4.6.

The surface cracking in the flatter areas and at higher depths of cover is expected to be typically between 25 mm and 50 mm in approximately 50 % of cases, between 50 mm and 100 mm in approximately 30 % of cases, between 100 mm and 150 mm in approximately 15 % of cases and greater than 150 mm in approximately 5 % of cases.

The surface cracking in the steeper areas and at shallower depths of cover is expected to be typically between 50 mm and 100 mm in approximately 60 % of cases, between 100 mm and 200 mm in approximately 25 % of cases, between 200 mm and 300 mm in approximately 10 % of cases and greater than 300 mm in approximately 5 % of cases. Multiple cracks resulting in deformations over several metres can also occur in some locations (i.e. less than 1 % of cases).

It is unlikely that the finds, artefacts and deposits themselves would be impacted by surface cracking. It is possible, however, that if remediation of the surface was required after mining, that these works could potentially impact the Aboriginal heritage sites.

It is recommended that Malabar develop appropriate protocols in the event that remediation of the surface is required in the locations of the isolated finds, artefact scatters and deposits. Further assessments of the potential impacts on these sites are provided by *AECOM* (2019).

6.15.4. Recommendations for the Aboriginal heritage sites

Recommendations for Aboriginal heritage sites have been provided by the specialist Aboriginal cultural heritage consultant for the EIS in the report by *AECOM* (2019). It is recommended that the Aboriginal Cultural Heritage Management Plan (ACHMP) include visual inspection of sites prior to mining within 500 m of the site and following the completion of active subsidence at the site. Protocols should be developed to manage sites that may be directly impacted by surface cracking or that may be disturbed during surface remediation activities.

6.16. Historic heritage sites

The locations of the historic heritage sites are shown in Drawing No. MSEC986-25. The details of these sites have been provided by *Extent Heritage* (2019).

Historic heritage sites identified by *Extent Heritage* (2019) are located outside the Study Area. The sites in the region include the Arrowfield Homestead, Bowfield Homestead, Edderton Homestead, Plashett Homestead, Randwick Homestead, Strowan Homestead, Woodlands Homestead and a stockyard.

The historic heritage sites are located at distances between 0.7 km and 5 km outside the proposed mining area. At these distances, these sites are predicted to experience negligible ground movements due to the proposed mining. The potential for mining-induced impacts on these historic heritage sites is considered to be negligible.

Further assessments of the historic heritage sites are provided by *Extent Heritage* (2019).

6.17. Survey control marks

The survey control marks are shown in Drawing No. MSEC986-24. The locations and details of the survey control marks were obtained from *Spatial Services* using the *SCIMS Online* website (SCIMS, 2018).

The survey control marks are located across the Study Area and, therefore, are expected to experience the range of predicted subsidence movements. A summary of the maximum predicted conventional subsidence movements within the Study Area is provided in Chapter 4.

Table D.01 - Details and maximum predicted subsidence effects for the Aboriginal heritage sites within the Study Area

AHIMS	Site type	Located above WN Seam mining area	Located above WH Seam mining area	Located above AF Seam mining area	Located above BF Seam mining area	Located outside of the mining areas	Maximum predicted total vertical subsidence after WN Seam (mm)	Maximum predicted total vertical subsidence after WH Seam (mm)	Maximum predicted total vertical subsidence after AF Seam (mm)	Maximum predicted total vertical subsidence after BF Seam (mm)	Maximum predicted total tilt after BF Seam (mm/m)	Maximum predicted total hogging curvature after BF Seam (1/km)	Maximum predicted total sagging curvature after BF Seam (1/km)

Salvage Methodology

1.0 Introduction

This research design and archaeological salvage methodology has been prepared to guide the archaeological salvage program recommended for artefact scatter with PAD sites 37-2-0004/37-2-0505. These sites lie adjacent within 100m of each and essentially comprise a single archaeological site. Salvage excavation and surface collection has been recommended as an appropriate mitigation measure for proposed impacts to this site on the basis of its scientific significance.

2.0 Salvage Objectives & Rationale

The overarching objectives of the salvage program are as follows:

- To salvage a representative and statistically viable subsurface assemblage of stone artefacts from 37-2-0004/37-2-0505;
- To investigate whether any sources of silcrete/tuff are located within proximity to sites 37-2-0004/37-2-0505;
- To undertake post-excavation analyses that will produce and conserve knowledge of past Aboriginal occupation of the sites; and
- To investigate the broader archaeological and cultural context of the sites through comparative analyses of the results of the current salvage program with those conducted in the greater Upper Hunter region.

3.0 Research Questions

The following general research questions will be used to guide the post-excavation analysis component of the salvage program:

1. When and how was the sites being utilised by Aboriginal people?
2. Are there naturally occurring deposits of silcrete/tuff gravels present associated with Saddlers Creek? If so, is there any evidence of quarrying of these materials by Aboriginal people?
3. If there is evidence of quarrying, how does that compare to other quarry sites in the Upper Hunter?
4. What, if any, evidence exists to indicate that Aboriginal people were deliberately heat treating stone at the sites?
5. What types of tools were being produced?
6. What raw materials are being utilised and where are they being obtained/quarried?
7. What technological and/or typological similarities/differences are apparent between the excavated stone artefact assemblages recovered from these sites and those from other local and sub-regional contexts?

4.0 Methodology

4.1 Open Area Excavation

In view of the demonstrated subsurface potential of sites 37-2-0004/37-2-0505 up to 100 m² of open area excavation will be undertaken at the site. The extent of open plan excavation at the sites will be driven by observed lithic distributions and the presence/absence of inset archaeological features such as raw material deposits, hearths and heat treatment pits.

The placement of the open area excavation within the site will be guided by a program of test excavation with a series of 1 m² pits placed on a 20 m grid within the portion of the site boundaries impacted by the project. The open area excavation will be centred on one or more locations where higher counts of artefacts, archaeological features, or the test pit with high richness values are intercepted.

The proposed excavation methodology is as follows:

- All excavation will be carried out manually using trowels, shovels and mattocks;
- Test excavation will proceed in 1 m² units placed on a 20 m grid across the impacted portion of the site;
- Open area excavation will proceed in 1 m² units, each of which will be assigned an alpha-numeric identifier;
- All excavation units will be excavated in 10 cm spits down to the base of the identified A₂ soil horizon;
- Photographic and scale-drawn records of representative soil profiles will be made;
- If specific archaeological features (e.g., hearths, heat treatment pits) are identified, the entire feature will be excavated and recorded prior to the continuation of excavation. Features will be photographed and scale plans drawn;
- Where encountered, charcoal deemed suitable for radiocarbon dating will be collected using 'best practice' guidelines (e.g., Burke and Smith 2004: 154);
- Soil samples will be retained for pH testing and soil description;
- Soil samples for OSL dating will be collected from selected strata using best practice guidelines (e.g., United States Geological Survey 2015);
- All excavated soils will be wet-sieved through 5 mm gauge sieves;
- Artefacts recovered from sieving will be retained in plastic zip-lock bags and labelled with appropriate provenance data; and
- All excavation units will be backfilled upon conclusion of excavation. The proponent will be responsible for arranging and undertaking this.

4.3 Geomorphological Assessment

A suitably qualified geomorphologist will be engaged to undertake a geomorphological assessment of excavated soils and soil profiles within excavation areas. This assessment will, at a minimum, involve the following:

- A desktop review of existing soil data and historic aerial photographs for the sites;
- A visual inspection of excavated soils and soil profiles during the salvage excavation; and
- Characterisation of extant soils and soil profiles using standard sedimentological techniques and terminology.

The engaged geomorphologist will provide a stand-alone report detailing the results of their assessment.

5.0 Post-Salvage Analyses & Reporting

All stone artefacts recovered during the salvage program will be subject to detailed technological analysis by a qualified archaeologist. Artefacts will be analysed to a level comparable to that achieved in previous analyses of excavated lithic assemblages in the Hunter Valley so as to facilitate a rigorous and meaningful comparative analysis of intra-regional assemblage composition.

A report detailing the results of the archaeological salvage program undertaken (including the results of any post-excavation analyses) will be completed within one year of the fieldwork component of the program. Reporting will be consistent with the best practice guidelines suggested by the *Code of Practice for Archaeological Investigation of Aboriginal Objects in NSW* (DECCW 2010b) and the *Aboriginal Cultural Heritage Standards & Guidelines Kit* (NSW NPWS 1997). Copies of the final salvage report will be provided to all RAPs and the OEH within 14 days of completion.

6.0 Care & Control of Recovered Artefacts

All Aboriginal objects salvaged as part of the excavation program should be curated in an appropriate manner, as determined through consultation with RAPs, the OEH and the DP&E during preparation of the ACHMP. Temporary off-site storage of salvaged objects should be allowed for the purposes of analysis and recording.
