MALABAR

Maxwell Underground Project
Environmental Monitoring Data
Quarter 3 2022

1 INTRODUCTION

This report has been compiled to present environmental monitoring data for the Maxwell Underground Coal Mine Project (the project) in accordance with:

- Schedule 2, Condition E17 (a) (vii) of SSD-9526; and
- Condition 5 of EPBC 2018/8287. Specifically this requires the inclusion of hydrographs for all monitoring bores and an explanation of what the data means in relation to the groundwater performance measures specified in the State development consent (SSD 9526).

This report covers the reporting period 1 July to 30 September 2022. Summaries of historic environmental monitoring data (prior to this report) can be found in the on the Malabar Resources website.

2 MONITORING RESULTS

Deposited dust monitoring results are provided in **Table 1**.

Continuous TEOM PM_{10} monitoring results are provided in **Figure 1**.

Continuous TEOM $PM_{2.5}$ monitoring results are provided in **Figure 1**.

Mine storage surface water quality monitoring results are provided in **Table 2**.

Downstream surface water quality monitoring results are provided in **Table 3**.

Surface water quality field measurements from Saddlers Creek are compared to trigger levels in **Table 4**.

Surface water quality laboratory results from Saddlers Creek are compared to trigger levels in **Table 5**.

Groundwater quality results for Maxwell Infrastructure bores are provided in **Table 6**.

Groundwater quality results for Maxwell Underground bores are provided in **Table 7**.

Groundwater level results are provided in **Table 8**.

Noise monitoring results are provided from **Table 9** to **Table 18**.

Locations of monitoring sites are shown in **Appendix 1** to **Appendix 4**.

Consultant hydrogeologist report providing the requirements of Condition 5 of EPBC 2018/8287, inclusive of hydrographs for all monitoring bores, and an explanation of the data relative to the groundwater performance measures in SSD 9526, is provided in **Appendix 5**.

Table 1: Deposited dust monitoring results for Quarter 3 2022.

Gauge	Insoluble Solids Result (g/m^2/month)			Annual Mean Limit (g/m^2/month)	Rolling Annual Average to end of September 2022 (g/m^2/month)
	April	May	June		
2175	0.7	0.6	2.1	4	***1.7***
2230	0.5	0.6	1.2	4	***1.5***
2235	0.6	0.8	1.6	4	***2.0***
2247	0.6	0.5	1.4	4	***1.4***

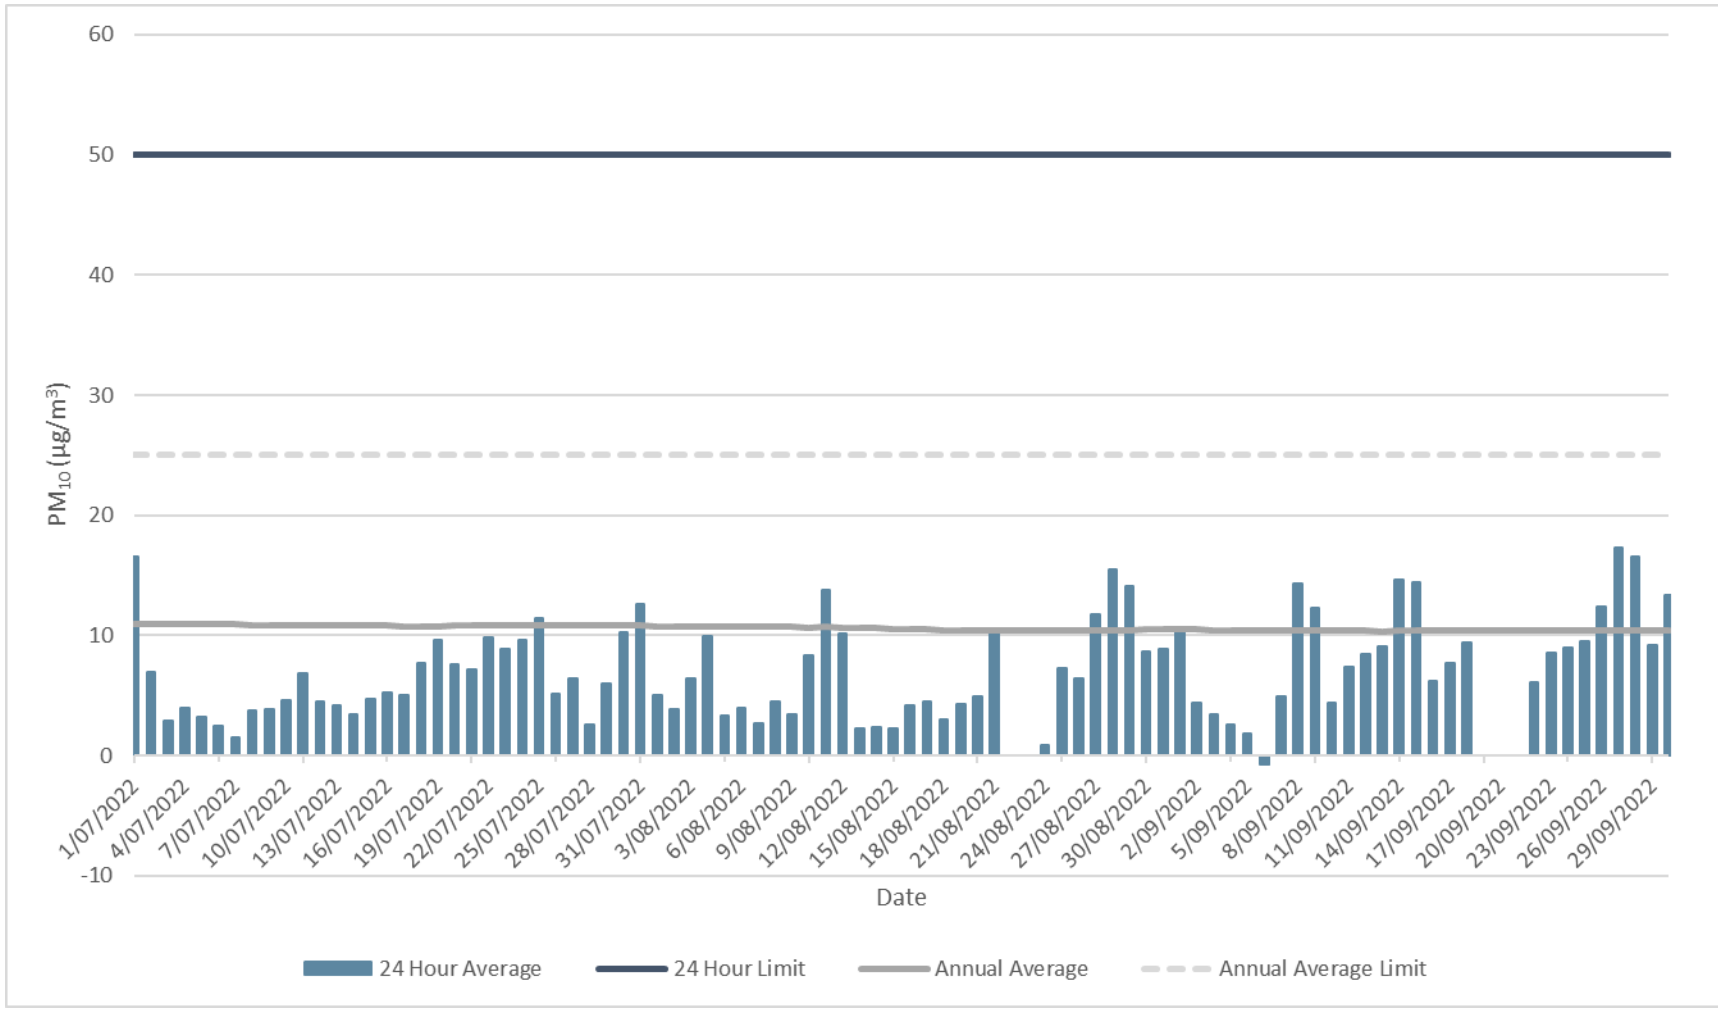

Figure 1: TEOM-1 PM_{10} monitoring results for Quarter 3 2022.

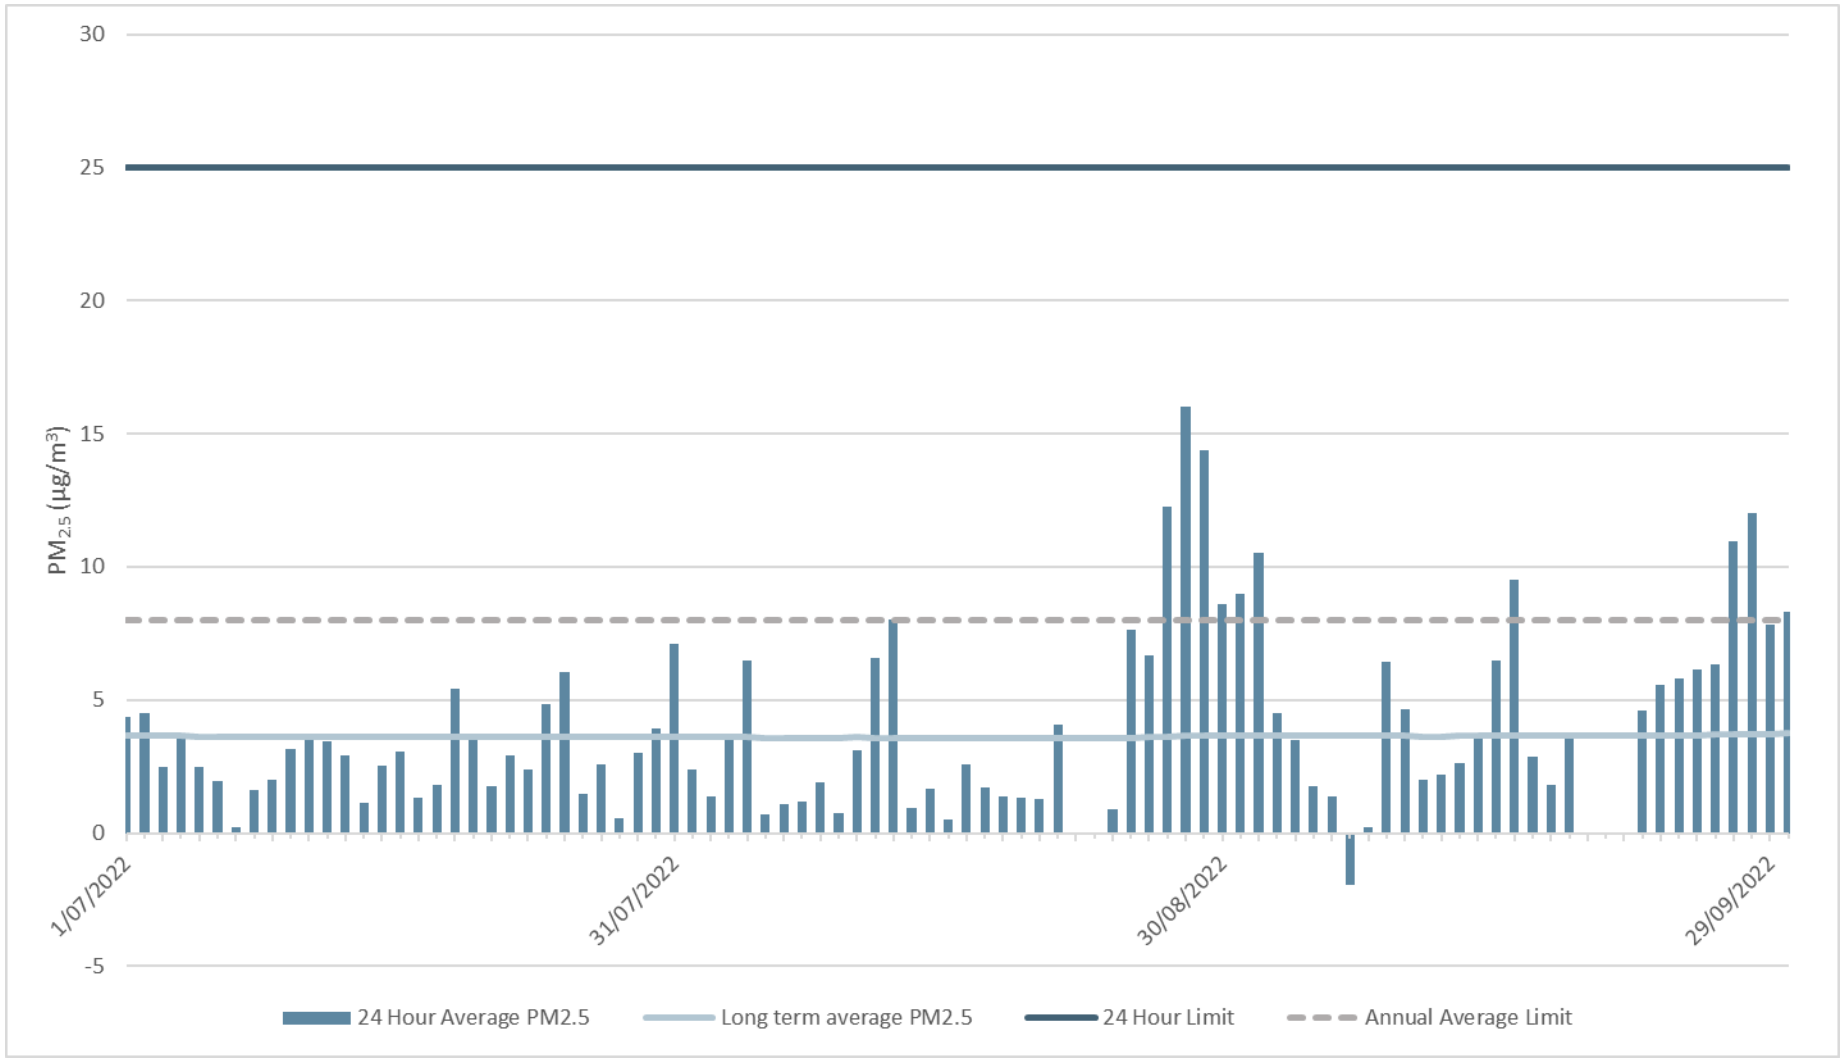

Figure 2: TEOM-1 $PM_{2.5}$ monitoring results for Quarter 3 2022.

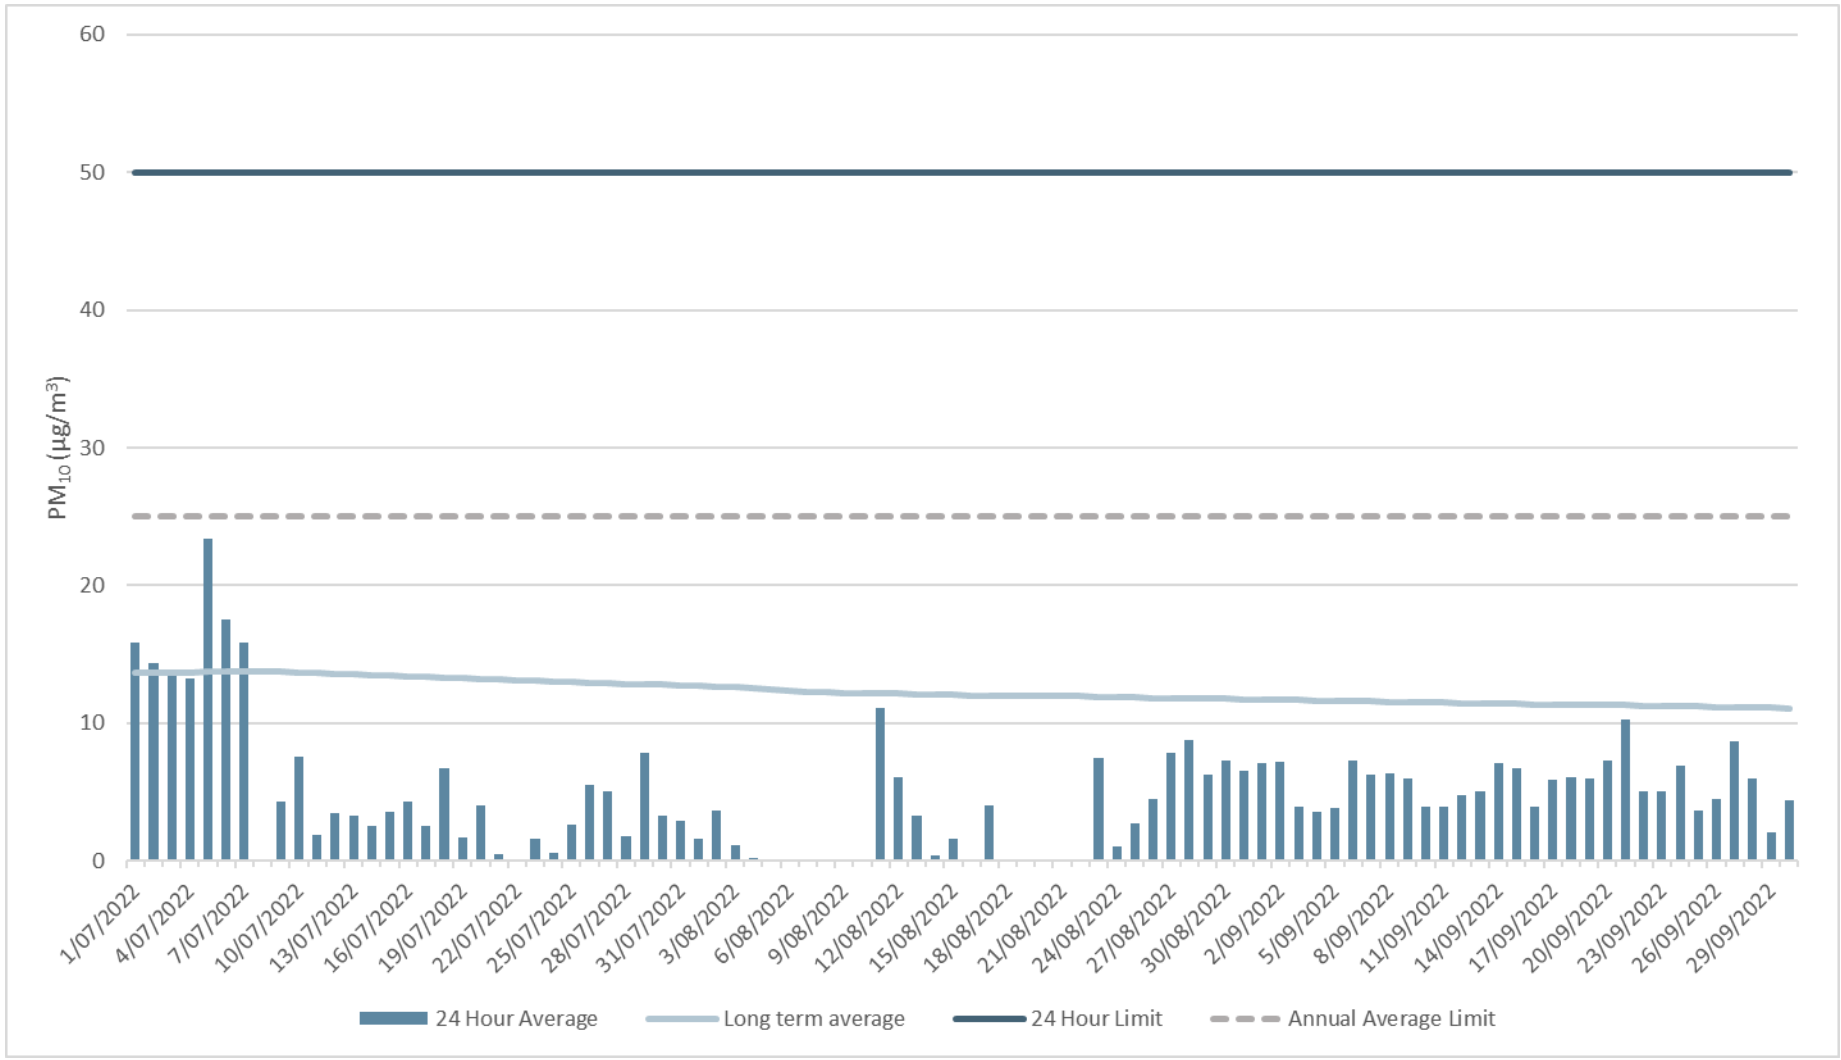

Figure 3: TEOM-2 PM_{10} monitoring results for Quarter 3 2022.

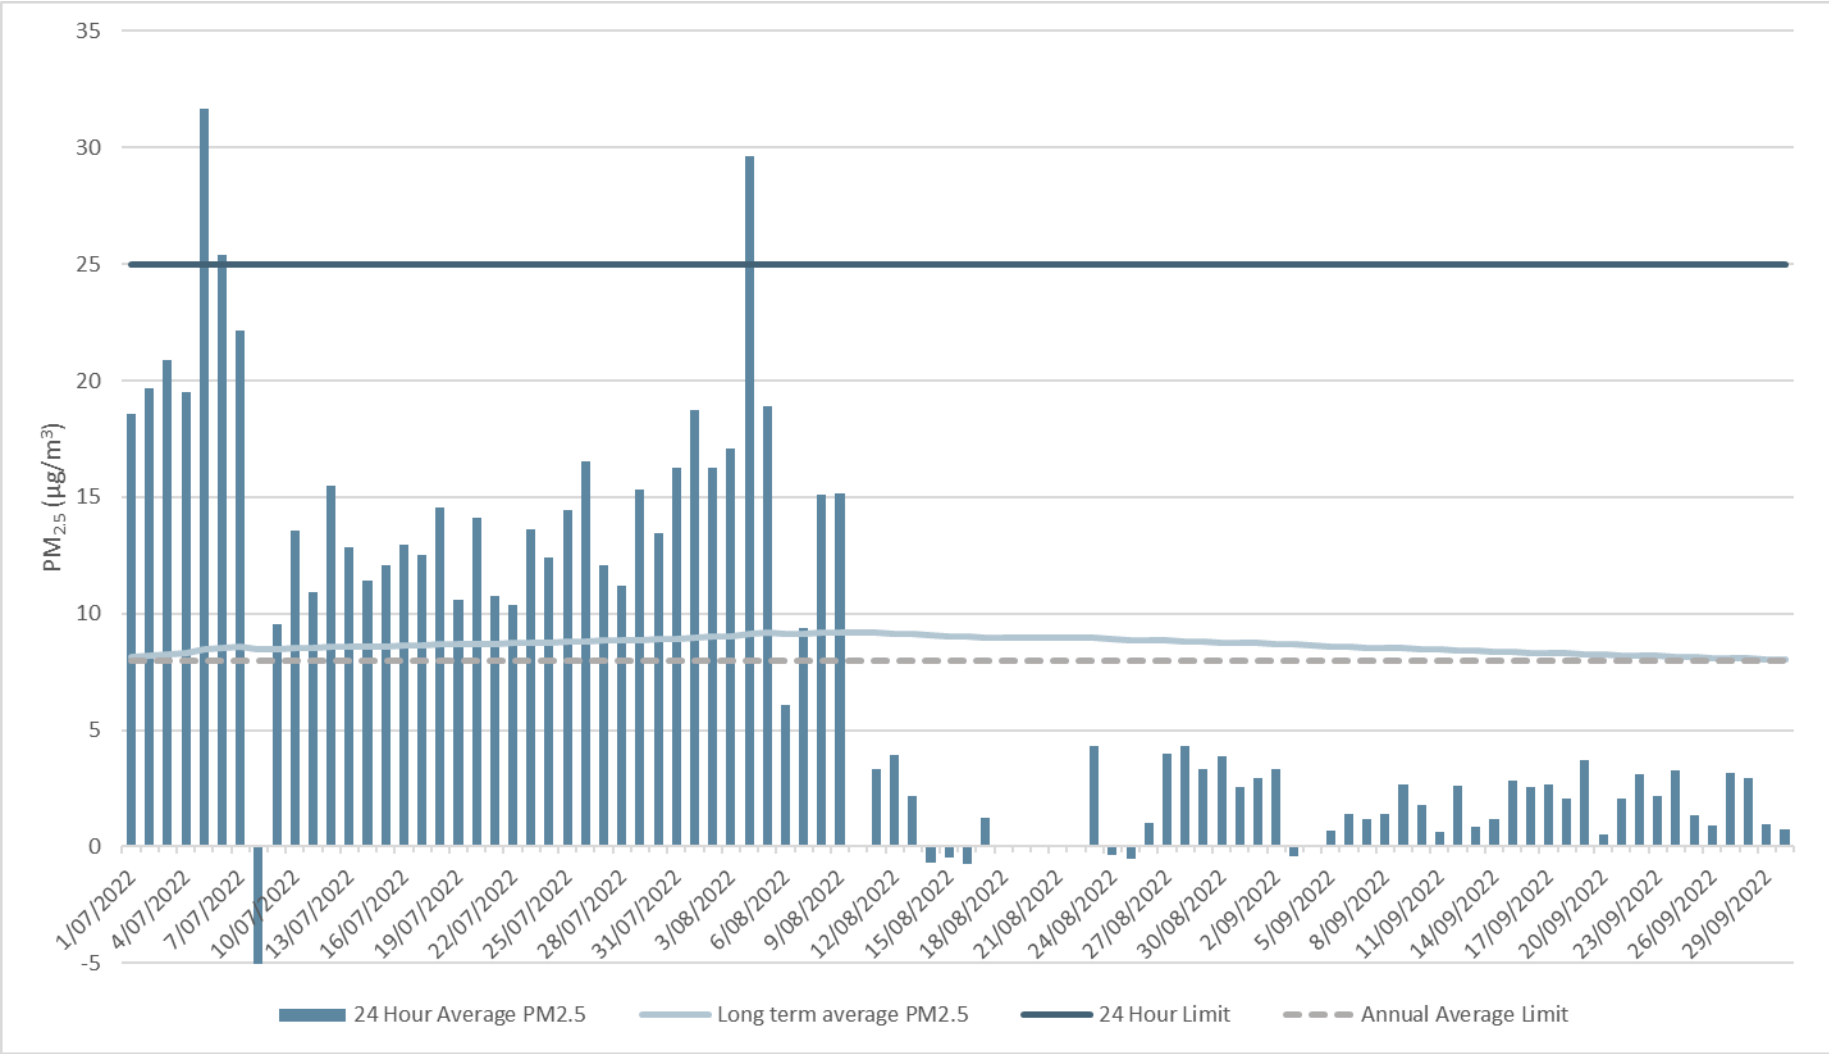

Figure 4: TEOM-2 $PM_{2.5}$ monitoring results for Quarter 3 2022.

Notes:

- Monitoring of PM_{10} and $PM_{2.5}$ commenced at TEOM-2 on 12 December 2021.
- All 24-hour averages during Quarter 3 2022 were below the 24-hour criteria for both PM_{10} and $PM_{2.5}$ at both TEOM-1 and TEOM-2. The results of the investigations into any exceedances of the criteria (if required) are provided in the Annual Review.
- The rolling annual averages remained very low during the reporting period, which reflects lower recorded concentrations following the significant rainfall for the year to date with the resultant higher vegetation cover locally and across regional NSW. Levels are much lower than those experienced in 2019 and early 2020, which were predominantly due to regional dust storms and bush fires.
- Gaps in data are due to maintenance and scheduled calibration by monitoring contractor, plus occasionally power cuts and equipment failure. Note that values close to zero may appear as gaps in data in the graphs.
- As a result of actual gaps in data resulting from events such as maintenance and scheduled calibration, the TEOM-generated rolling 24-hour average value is reported by the TEOM as zero (ie invalid). In accordance with Malabar's data validation process, where such events result in >75% valid 1-hour data during the 24-hour period midnight to midnight, this 1-hour data is used to manually calculate the 24-hour average. This process has been applied from Q1 2022. Prior to this the raw data from the TEOM has been presented.
- Specific data gaps for this reporting period are noted as follows:
  - TEOM-1 (CHP TEOM) 22–23/8/22: Scheduled annual calibration resulting in <75% data capture for 2 days, as the calibration process requires a zero filter to be placed on day one and removed 24 hours later.
  - TEOM-2: As reported in the Q2 report, there has been an issue with the data from TEOM-2 during the monitoring period. Advice from our monitoring contractor is that the TEOM was not controlling its internal operating temperatures correctly due to an electrical fault/circuit board. It also developed a leak in some internal seals that caused negative results. The instrument has been sent to the equipment manufacture in the US (Lear Siegler) to diagnose. A replacement (hire) instrument was installed; further detail will be provided in the Q4 report. The issue with the TEOM has caused the long term $PM_{2.5}$ average to exceed the assessment criterion for a short period.

Table 2. All mine water storage monitoring locations: laboratory water quality monitoring results for Quarter 3 2022 (year to date average shown). See notes for further details.

Site	Month	Bicarbonate ($CaCO_3$) (mg/L)	Calcium (mg/L)	Chloride (mg/L)	EC (µS/cm)	Magnesium (mg/L)	pH	Potassium (mg/L)	Sodium (mg/L)	Sulphate (SO_4) (mg/L)	TSS (mg/L)	TDS (mg/L)

Notes:

The year-to-date value consists of an average of the quarterly sample for the current quarter plus the three previous quarters, as per the Water Management Plan. The exceptions are for the V Notch dam, where samples are taken monthly as is required by the EPL and for the ES Void where monthly samples have been taken in October and November 2021 and then fortnightly samples from 25 October 2022, then monthly from 6 December 2022 to inform the design of the water treatment plant for the underground project and hence are included here for completeness.

Table 2 excludes mine water storages yet to be constructed (MEA dam, Mine Water Dam, Treated Water Dam, MEA Sedimentation Dam).

Table 3. All downstream surface water monitoring locations: laboratory surface water quality scheduled monitoring results for Quarter 3 2022 compared to year-to-date averages (Q4 2021–Q3 2022). See notes for further details.

Notes:

In addition to quarterly scheduled sampling, the MUG Project Water Management Plan requires sampling and analysis following 25mm or more of rain over a 24-hour period (defined as midnight to midnight and as recorded at the Drayton South meteorological recording station (AWS-2)). The results from any such post-rainfall events have been included in the year-to-date averages.

The quarterly field measurements of pH, EC, redox potential and temperature are recorded to enable subsequent evaluation in case of need and are not included in the quarterly reporting.

The location of the Transport and Services Corridor sediment dams (eg SW2) are to be confirmed as they are yet to be constructed hence monitoring has not yet commenced.

All results are in mg/L except Conductivity (µS/cm), pH (in pH units) and turbidity (nephelometric turbidity units).

The following will be reported in the AEMR:

- Comparison of water quality results from Saddlers Creek against Water Quality Trigger Values
- Results from the automatic weather stations (AWS-1 and AWS-2)
- Results of the stream health monitoring.

Table 4. Surface water scheduled field measurements at sites along Saddlers Creek for Q4 to Q3 2022 and comparison against trigger levels. If an exceedance of the trigger level occurs for three consecutive readings, this is highlighted in red. TLTS = too low to sample.

Site		Field result											
		pH				EC				Turbidity			
	Units	pH				µS/cm				NTU

SW1/ Saddlers		7.8	7.6	8.0	7.8	17,840	1,350	5,160	6,001	3.4	7.9	19.4	6.4
SW2	Not yet operational	-	-	-	-	-	-		-	-	-		-
SW3		Dry	Dry	TLTS	8.1	Dry	Dry	TLTS	355	Dry	Dry	TLTS	88

Notes

- Any exceedances of trigger values will only be investigated if they occur after construction commences.

- Turbidity results presented are laboratory results; from Q2 2022, a field meter has been used to determine turbidity; this enables direct comparison against the field trigger values for turbidity.
- Trigger for turbidity calculated by WRM Water based on the 80th percentile of the entire laboratory NTU dataset to end of 2021.

Table 5. Surface water laboratory results at sites along Saddlers Creek (scheduled and post-rainfall sampling) from Q4 2021 to Q3 2022 and comparison against trigger levels. If an exceedance of the trigger level occurs for three consecutive readings, this is highlighted in red.

Notes.
(a) No trigger; for interpretation purposes only. (b) Result is a combination of As (V) and As (III) (c) Trigger set as a preliminary guideline value.
In accordance with the Surface Water Management Plan, results from Saddlers Creek (median over three consecutive samples) will be compared to the relevant trigger levels. Trigger values are values that trigger further investigation or management action.

Table 6: Maxwell Infrastructure Groundwater quality biennial monitoring results for Quarter 3 2022 (year to date average shown). See notes for further details. NS = Not sampled (next scheduled sampling is Q4 2022).

Notes:

The Maxwell UG (MUG) Project Water Management Plan (WMP) was implemented for Q3 2021 and supercedes the requirements of the Maxwell Infrastructure WMP. The MUG Project WMP requires:

- the monthly recording of reduced standing water levels in all bores (standpipes either manually or using loggers and VWPs)
- quarterly recording (field measurement) of all standpipes for pH, EC, redox potential and temperature; and
- biennial sampling and analysis of all standpipes for TDS, TSS, major cations (Ca, Mg, Na), major anions (chloride, sulfate, carbonate, bicarbonate), total alkalinity, and total and dissolved metals (Al, As, B, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Se, Ag & Zn).

Of these, the following are new or amended variables required by the new MUG WMP:

- monthly rather than quarterly recording of reduced standing water levels where there are no loggers (however the long-term plan is to install loggers in all bores); for those with loggers and for the VWPs the data is downloaded quarterly;
- quarterly recording (field measurement) of redox potential and temperature (previously not required);
- biennial sampling and analysis for carbonate and total alkalinity (previously not required); these will be added to the table for Q4 2021 given the first sampling under the new plan occurred in Dec 2021;
- removal of the requirement to record barium (Ba), beryllium (Be), cadmium (Cd), cobalt (Co), potassium (K), vanadium (V), nitrite as N, nitrate as N, mercury (Hg), ammonia as N, total Kjeldahl nitrogen as N, total phosphorus (P) and reactive phosphorus as P.
- removal of bores DD1030, DD1034-A and B, DD1041 A and B.

Sampling for the MI bores under the previous Maxwell Infrastructure WMP transitioned to the new MUG Project WMP. Sampling of the MI bores occurred in June 2022 and hence the quarterly reporting for Q3 2022 includes the results. Sampling of the MUG bores occurred in Q1 2022 hence no results are reported for Q3 2022.

The year-to-date averages includes samples taken on a quarterly basis until the implementation of the new MUG Project WMP, which requires biennial sampling. The exception is for DS1 for which monthly samples are taken as per the EPL for pH, EC, TDS and salinity, and hence the average presented is the average of all samples taken during each of the past 12 months for those variables.

All results are in mg/L except Conductivity (µS/cm), pH (in pH units) and salinity (g/kg). Dissolved metal concentration (mg/L) are presented in **Table 6, Table 7, Table 8.** Plots of total and dissolved metal concentrations are shown in **Appendix 5**.

Trigger levels

As presented in SLR (2022, 2022a) Q2 – 2022 and Q3 - 2022 quarterly reports, observed groundwater levels, EC and pH at monitoring bores that are part of the TARP remain within “Normal Condition” during the reporting period except for GW02D. To note that further monitoring data is required at GW02D to confirm EC groundwater trends as it remains above the trigger level. However, it is likely that the increase in EC at this location is not related to site activities hence does not result in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526.

Table 9. All groundwater bores: Reduced standing groundwater levels (mAHD) during Quarter 3 2022 compared to the year-to-date average

1. In addition to a water level logger, a barologger was installed at MB3-Regolith on 23 August 2021 (a barologger enables the correction of water level for barometric pressure for all bores for this project). Prior to August, it was installed at DD1032.
2. In August 2021, loggers in DD1043, DD1057, DD1014, DD1025 and DD1032 were removed and placed into other bores that the Environmental Statement committed to containing loggers.

3. GWLs for the Maxwell Infrastructure loggers are the values on the same day as the manual measurements taken in the bores without loggers. See notes under Table 7 for an explanation of any NS.
4. GWLs for the Maxwell Underground loggers are the values taken on the 15th of each month (as the manual measurements are taken over a number of days due to the number of loggers). If there are multiple values on the same day, the average of the daily values is presented.
5. New Solinst Levelogger 5's were installed in MB03, MB1 – Alluvial, MB4 - Alluvial, MB3 – Alluvial, MB2 – Regolith, GW01D, GW01S, GW02D and GW02S in August 2021. In addition, older loggers from DD1057, DD1014, DD1015, DD1025 and DD1032 were relocated to MB2 – Alluvial, MW2, MW1, MB3 – Regolith. Malabar became aware of an issue with the firmware installed on these new loggers in January 2022; the issue caused the loggers to stop recording in mid-November. Following identification of the issue and in consultation with Solinst, the firmware was upgraded and the loggers were redeployed in February 2022. Manual measurements recommenced monthly at all bores in January 2022 and will continue until confidence in the loggers can be obtained. Data in this table is therefore manual measurements unless not taken; if manual measurements were not taken an average of the monthly logger recordings are included, where available. Hence for those bores, there is a gap in data between mid-November 2021 and when the monthly manual measurements recommenced in January 2022.
6. DD1015 is reported blocked during the reporting period.
7. There was no access to DD1027 in July 2022 due to wet weather.
8. MB03 and MW3 are recorded dry during the reporting period.
9. Groundwater levels at RD1189 VWP2, VWP3, VWP5, VWP7 appear unstable hence are not reported.
10. The following VWP are disabled: RD1192-VWP1, MB1-VWP1, WND16-VWP4.

* GWLs for the Maxwell Underground VWPs are the values taken on the 15th of each month. If there are multiple values on the same day, the average of the daily values is presented. If no data is recorded on the 15th of the month, then the closest recorded value to the 15th of the month is presented (see*).

Acronyms: DD = diamond drill hole. mAHD = meters above Australian Height Datum (the elevation of the water level is calculated by subtracting the Depth to Water from the reference elevation). n/a = not available. NS = not sampled. RH = rotary drill hole. VWP = Vibrating wire piezometer and logger. Seam acronyms: BK = Blakefield seam; BY = Bayswater seam; MA = Mt Arthur seam; PF = Piercefield seam; INT = Interburden; WB = Wambo seam; RB = Redbank Creek seam; WA = tbc; WH = Woodlands Hill seam; WN = Whynot seam; WY = Wynn seam. WW = Warkworth seam; ZZ = indicates that the seam is intruded or heat affected.

Noise monitoring results for Quarter 3 2022

Noise monitoring under the Noise and Blasting Management Plan (NBMP) for the Maxwell Underground Coal Mine Project commenced in September 2021 at monitoring sites NM1 to NM4 as required by the plan.

To date, the Maxwell Underground Project has been inaudible at all locations and all dates.

Table 10. Noise monitoring results for 19 July 2022

EPA identification no.	Sampling point	Day ($L_{A\ eq\ (15\ minute)}$)		Evening ($L_{A\ eq\ (15\ minute)}$)		Night ($L_{A\ eq\ (15\ minute)}$)		Night ($L_{A1\ (1\ minute)}$)		Exceedance (yes/no)	Observations

Memorandum

To:	Alex Newton	At:	Malabar Resources Pty Ltd
From:	Maxime Philibert	At:	SLR Consulting Australia Pty Ltd
Date:	11 April 2023	Ref:	610.30966.00000-M02-v4.0-20230411.docx
Subject:	Maxwell Project Quarterly Groundwater Monitoring Report Q3 2022 July - Sept 2022		

1 Introduction

SLR Consulting Australia Pty Ltd (SLR) has been commissioned by Malabar Resources to perform a quarterly groundwater review of data collected by Cbased Environmental for the Maxwell Underground (MUG) and Maxwell Infrastructure referred here as the Maxwell Project. The quarterly groundwater assessment will support the annual review compliance reporting conducted by Malabar Resources for the site and is envisaged to act as an early warning procedure for any performance trigger exceedances.

This memo provides an overview of the groundwater data collected at the relevant monitoring bores (refer to Figure 1 for the location) for the period July–September 2022 and assesses this data against the Trigger Action Response Plan (TARP) Trigger Criteria presented in the Groundwater Management Plan (GWMP) contained within the Water Management Plan (November 2021) for the Maxwell Underground Project. Discussion of any recorded exceedances or bores anticipated to exceed is also included in Section 2 and Section 3.

There was no mining activity conducted for the Maxwell Underground Project (the Project) during the review period. Construction of the Project commenced in May 2022 and extraction of the secondary workings will likely occur in Q1 2023.

1.1 Groundwater Data

The following outlines any data gaps in groundwater levels or quality identified for the review period:

- Groundwater levels and quality results for private bores are reviewed annually, no groundwater data is available for private bores and therefore not presented for this review period; and

1.2 Groundwater Monitoring Parameters and Frequency

The groundwater monitoring parameters and the frequency of monitoring as per the GWMP is presented below:

- Standpipes
  - Reduced standing water level (for bores with no data logger) – monthly
  - pH, electrical conductivity, redox potential, temperature – quarterly

    - Total dissolved solids, total suspended solids, major cations/anions, total alkalinity, dissolved and total metals – biennial (twice yearly)
- DS1 (in accordance with EPL 1323 Condition U1.1)
    - Reduced standing water level, pH, electrical conductivity, total dissolved solids, salinity – monthly
- Data loggers and VWPs
    - Reduced standing water level – downloaded quarterly

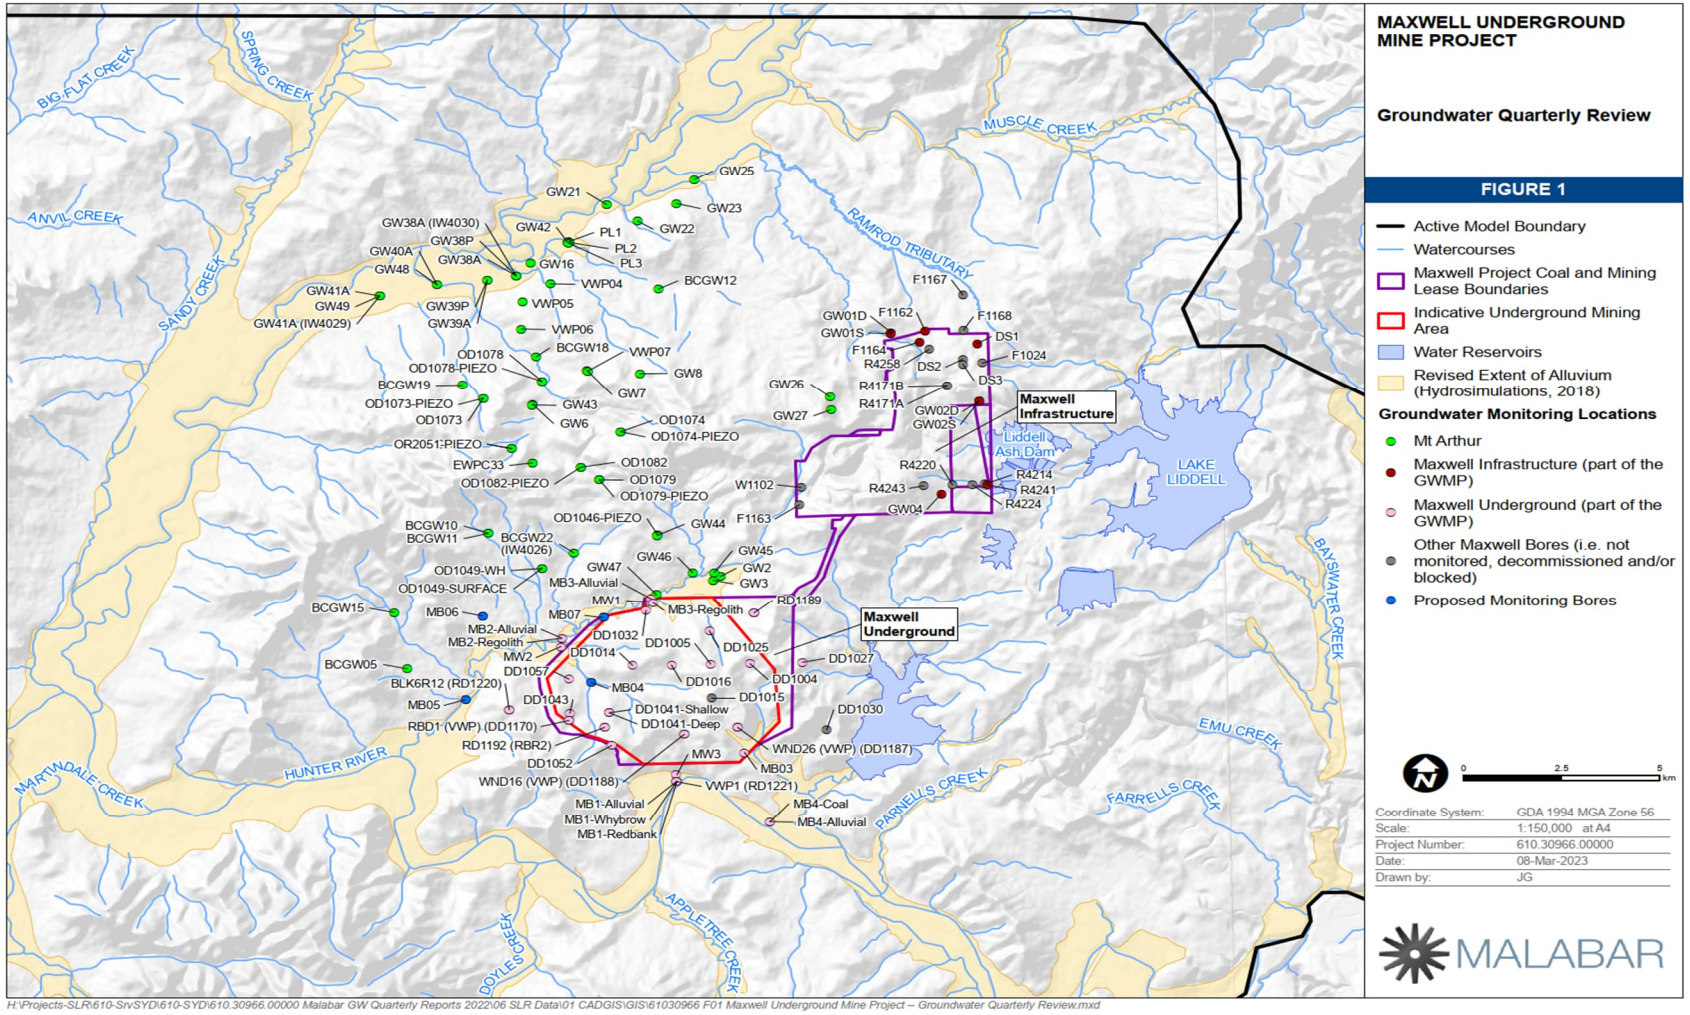

Figure 1 Groundwater Monitoring Network

2 Groundwater Level Trigger Review

This section addresses the compliance of groundwater levels at MUG and MI during the reporting period in relation to a trigger analysis.

All groundwater level monitoring bores and VWPs in the vicinity of the Maxwell Project, and their available completion details, are listed in Table 1 below.

Table 2 outlines groundwater level trigger exceedances during the review period at each of the monitored bore locations as per the approved trigger criteria (Malabar Resources, Nov 2021) presented in Appendix A. Hydrographs for all groundwater monitoring locations including those with approved groundwater level trigger levels are presented in Appendix B (MI bores: Figures B1-B9; MU bores/VWP: Figure B10-B39).

Section 2.1 to Section 2.3 discusses briefly any groundwater level exceedances observed during the reporting period only, as identified in Table 2.

LX: maximum trigger level exceedances recorded *"-": no observed drawdown due to mining* *#: not applicable* N:Normal Level TARP Level 1 TARP Level 2

"" no groundwater level data available for this period*

^Year to date average: average groundwater levels including Q3 2022 data, prior the start of mining it is recommended to establish a baseline level for groundwater level at each groundwater monitoring site within the TARP whether it is taking the groundwater level prior to mining or average of groundwater levels at a specific period.

2.1 Normal Level

Groundwater levels at the Maxwell Infrastructure groundwater monitoring sites R4241, GW01D, GW01S, GW02D, GW02S (Appendix B, Figure B4-B8) and at the Maxwell Underground sites DD1025, DD1032, MB3-Alluvial and MB3-Regolith (Appendix B, Figure B14-B15 and Figure B25-B26) are observed above the groundwater trigger level over the reporting period hence are within the Normal Level of the TARP criteria (Appendix A - Table A1).

2.2 TARP Level 1

There were no TARP Level 1 groundwater level trigger exceedances over the reporting period.

2.3 TARP Level 2

There were no TARP Level 2 groundwater level trigger exceedances over the reporting period.

2.4 General Observations

- Groundwater monitoring bores MB03 and MW3 were reported as dry during the review period and DD1015 is reported as blocked as of June 2022.
- No access was possible at DD1027 due to wet weather.
- Groundwater levels at RD1189 VWP2, VWP3, VWP5, VWP7 appear unstable hence are not reported for the review period onwards.
- The following VWPs are disabled: RD1192-VWP1, MB1-VWP1, WND16-VWP4 hence no groundwater data for these sites are presented in this review period onwards.

3 Groundwater Quality Trigger Review

Approved Trigger Action Response Plan (TARP) levels are defined for five sites for the Maxwell Infrastructure area and four sites for the Maxwell Underground area (Malabar Resources, Nov 2021) and are presented in Appendix A.

An assessment of groundwater quality (EC and pH) at each of the monitored bore locations against the TARP trigger levels has been undertaken. EC and pH plots for groundwater monitoring locations with approved groundwater quality trigger levels are presented in Appendix C (Figures C1-C18). During the reporting period, EC and pH recorded at the groundwater monitoring sites and within the TARP are observed within a Normal Level.

A summary of the groundwater quality (electrical conductivity and pH) trigger levels during the reporting period at the monitored bores are presented in Table 3.

No groundwater quality results were available for the private bores for the reporting period. Results for the private bores are reviewed annually.

Table 3 Trigger Exceedances for pH and EC for the period July-September 2022

Bore	Period [month sampled]	Trigger Level Exceedance		
		EC (µS/cm)	pH lower	pH upper
R4241	Q3-2022 [Sep 22 - field]	N	N	N
GW01S	Q3-2022 [Sep 22 - field]	N	N	N
GW01D	Q3-2022 [Sep 22 - field]	N	N	N
GW02S	Q3-2022 [Sep 22 - field]	N	N	N
GW02D	Q3-2022 [Sep 22 - field]	Y	N	N
DD1025	Q3-2022 [July 22 – field & lab]	N	N	N
DD1032	Q3-2022 [July 22 – field & lab]	N	N	N
MB3-Alluvial	Q3-2022 [July 22 – field & lab]	N	N	N
MB3-Regolith	Q3-2022 [July 22 – field & lab]	N	N	N
Private Bores	No data available	#	#	#

N: Normal Level TARP Level 1 TARP Level 2

Y: "Yes", short-term exceedance, less than 3 consecutive exceedances.

3.1 Normal Level

Groundwater quality at the Maxwell Infrastructure groundwater monitoring sites R4241, GW01D, GW01S, GW02S (Appendix C, Figure C1-C10) and at the Maxwell Underground sites DD1025, DD1032, MB3-Alluvial and MB3-Regolith (Appendix C, Figure C11-C18) are observed below the trigger level over the reporting period hence are within the Normal Level of the TARP criteria (Appendix A - Table A1).

3.2 TARP Level 1

There were no TARP Level 1 groundwater quality trigger exceedances over the reporting period.

3.3 TARP Level 2

There were no TARP Level 2 groundwater quality trigger exceedances over the reporting period.

3.4 General Observations

The following section presents an overview of bores showing an increasing trend in one of the groundwater quality parameters or bores that could be anticipated to exceed in the next review periods.

GW02D – groundwater EC slightly decreased to 11,700 µS/cm in September 2022 (field measurement) compared to 12,000 µS/cm in June 2022. EC remains above the trigger level however the increase in EC could be influenced by a build-up of sediment at the bottom of standpipe GW02D and limited rainfall recharge as Malabar Resources noted that the logger was suspended in mud in December 2021. It is likely that the increase in EC above the trigger level at GW02D is not caused by site activities and will not result in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526. As presented in SLR (2022), further monitoring in the next review period at GW02 is required to confirm EC trends (i.e. next sampling event planned for December 2022) .

4 Recommendations

Based on the trigger exceedances assessed in Section 2 and Section 3 and the TARP criteria presented in Appendix A, the following actions are recommended:

4.1 Actions – Trigger Assessment

- Continue the monitoring program, reporting groundwater level and quality data in the next groundwater quarterly review report in December 2022.
- For all sites with a Normal Level in place for groundwater levels, continue monitoring groundwater trends against TARP trigger levels.
- For all sites with a Normal Level including GW02D in place for groundwater quality continue monitoring pH and EC against TARP trigger levels.

4.2 Actions – Reporting

- Prior to mining commencing at Maxwell Underground it is recommended to identify an appropriate baseline groundwater level at each groundwater monitoring location within the TARP. This will be used as the reference level for future reviews to calculate groundwater drawdown at bores (i.e. if any mining related effect is observed).

4.3 Actions – Monitoring and Sampling

- Remove DD1015 from the Groundwater Management Plan. Work to unblock the bore has been attempted by CBased in February 2022.

Checked: ST

APPENDIX A

Trigger Action Response Plan and Groundwater Level Triggers

Table A1 Trigger Action Response Plan for the Maxwell Project monitoring bores – Groundwater Levels and Quality

Status	Trigger	Action	Response
Maxwell Infrastructure			
Normal	Groundwater level and quality below Maxwell Infrastructure Stage 1 groundwater triggers (*Table A3*).	Continue to minimise the long-term catchment areas of the mine voids and transfer water to and from voids. Continue water balance monitoring, groundwater monitoring, and assessment.	None
Level 1	Three consecutive groundwater level, pH or EC results exceed Maxwell Infrastructure Stage 1 groundwater triggers (*Table A3*).	A suitably qualified hydrogeologist reviews groundwater level or quality data to determine if trigger exceedances are caused by site activities and whether this has resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526.	If trigger exceedances are not caused by site activities and have not resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526, then review monitoring frequency. If trigger exceedances are caused by site activities and resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526, then undertake Level 2 Actions.
Level 2	Investigation following Level 1 trigger review indicates trigger exceedances are caused by site activities and this has resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526.	Undertake actions recommended by suitably qualified hydrogeologist which may include update to the groundwater model and/or review of monitoring program.	Report non-compliance. Undertake adaptive management strategies.
Maxwell Underground			
Normal	Groundwater level and quality below Maxwell Underground Stage 1 groundwater level triggers (*Table A3*).	Continue groundwater monitoring, and assessment.	None
Level 1	Three consecutive groundwater level, pH or EC results exceed Maxwell Underground Stage 1 groundwater level triggers (*Table A3*).	A suitably qualified hydrogeologist reviews groundwater level or quality data to determine if trigger exceedances are as a result of activities at the site and whether this has resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526.	If trigger exceedances are not caused by site activities and have not resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526, then review monitoring frequency. If trigger exceedances are caused by site activities and resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526, then undertake Level 2 Actions.
Level 2	Investigation following Level 1 trigger review indicates trigger exceedances are caused by activities at the Project and this has resulted in an exceedance of a Water Management Performance Measure in Table 4 of Development Consent SSD 9526.	Undertake actions recommended by suitably qualified hydrogeologist which may include update to the groundwater model and/or review of monitoring program.	Report non-compliance. Undertake adaptive management strategies. In consultation with suitably qualified hydrogeologist and other relevant specialists, undertake repair, mitigate and/or offset any adverse groundwater impacts of the development.

Table A2 Trigger Action Response Plan for Privately-owned bores - Groundwater Levels and Quality

Status	Trigger	Action	Response
Groundwater levels			
Normal	Drawdown at privately-owned bores less than 2 m. No complaints about potential impacts of the site on privately- owned bores.	Continue regular monitoring and review of potentially impacted private bores (*refer to Section 5.2.2 of the GWMP*).	None
Level 1	Drawdown at privately-owned bores more than 2 m and/or complaint about potential impacts of the site on private bores.	A suitably qualified hydrogeologist reviews groundwater data to determine if 2 m drawdown is as a result of activities at the site (and/or MAC). Collect relevant data on privately-owned bores that are the subject of the complaint. Suitably qualified hydrogeologist to determine if privately-owned bore the subject of the complaint has been adversely and directly impacted as a result of the development (other than an impact that is minor or negligible).	If drawdown is not as a result of activities at the Project (and/or MAC) then review monitoring frequency. If privately-owned bore the subject of the complaint has not been adversely and directly impacted as a result of the development (other than an impact that is minor or negligible) then review monitoring frequency. If drawdown, or impacts the subject of the complaint, are due to site activities then undertake Level 2 actions.
Level 2	Investigation following Level 1 trigger review indicates drawdown is as a result of activities at the site.	Notify relevant bore owner and implement compensatory water supply actions. Undertake any other actions recommended by suitably qualified hydrogeologist which may include update to the groundwater model and/or review of monitoring program.	Review groundwater monitoring program.
Groundwater quality			
Normal	No change in beneficial use category	Continue regular monitoring and review of potentially impacted private bores (refer to *Section 5.2.2 of the GWMP*).	None
Level 1	Two consecutive monitoring results indicate a change in beneficial use category.	A suitably qualified hydrogeologist reviews groundwater data to determine if change in water quality is caused by activities at the site.	If a privately-owned bore has not been adversely and directly impacted as a result of the activities at the site, then review monitoring frequency. If change in water quality is changed by activities at the site, then undertake Level 2 actions.
Level 2	Investigation following Level 1 trigger review indicates change in water quality is caused by activities at the site.	Implement compensatory water supply actions. Undertake any other actions recommended by suitably qualified hydrogeologist which may include update to the groundwater model and/or review of monitoring program.	Review groundwater monitoring program.

Table A3 Summary of groundwater level and quality triggers for alluvium and hard rock aquifers (Maxwell Project) – (GWMP – Malabar Resources, Nov 2021)

Bore	Groundwater level, trigger level (mAHD)	pH trigger level - minimum	pH trigger level - maximum	EC trigger level (µS/cm)
Maxwell Infrastructure				
R4241	173.6	6.0	8.5	6,253
GW01D	198.2	6.0	8.5	5,680
GW01S	197.0	6.0	8.5	9,260
GW02D	135.7	6.0	8.5	10,500
GW02S	187.7	6.0	8.5	9,480
Maxwell Underground				
DD1025	157.3	6.0	8.5	14,200
DD1032	130.6	6.0	8.5	7,170
MB3-A	127.7	6.0	8.5	9,009
MB3-R	127.3	6.0	8.5	6,327

Table A4 Groundwater Quality Categories: Electrical Conductivity - (GWMP – Malabar Resources, Nov 2021)

Beneficial use	Quality Range	Description
Marginal Potable	800 – 2,350 µS/cm (500 - 1,500 mg/L TDS)*	At the upper level this water is at the limit of potable water, but is suitable for watering of livestock, irrigation and other general uses
Irrigation	2,350 – 7,800 µS/cm (1,500 - 5,000 mg/L TDS)*	At the upper level, this water requires shandying for use as irrigation water or to be suitable for selective irrigation and watering of livestock
Saline	7,800 – 22,000 µS/cm (5,000 - 14,000 mg/L TDS)*	Generally unsuitable for most uses. It may be suitable for a diminishing range of salt-tolerant livestock up to about 6,500mg/L [~10,150 µS/cm] and some industrial uses
Highly Saline	>22,000 µS/cm (14,000 mg/L TDS)*	Suitable for coarse industrial processes up to about 20,000 mg/L [~31,000 µS/cm].

* Approximate EC ranges derived from TDS ranges, with conversion factor of 1.5625 applied. Source: National Land and Water Resources Audit (Murray Darling Basin Commission, 2005).
