Summary

DETAIL	
Mine	Maxwell Underground Coal Mine
Reference	FWP0001373
Forward program commencement date	Saturday 3 February 2024
Forward program end date	Tuesday 2 February 2027
Forward program revision (if applicable)	
Contact	Donna McLaughlin
Mining leases	ML 1531 (1992), CL 229 (1973), ML 1822 (1992), CL 395 (1973), ML 1820 (1992)
Project location	MAXWELL VENTURES (MANAGEMENT) PTY LTD
Date of submission	Wednesday 27 March 2024

Important

The department may make the information in your program and any supporting information available for inspection by members of the public, including by publication on its website or by displaying the information at any of its offices. If you consider any part of your program to be confidential, please communicate this to the department via the message function on this submission within the NSW Resources Regulator Portal.

Three-year forecast – surface disturbance activities

Project description

Maxwell Ventures (Management) Pty Ltd (Maxwell), a wholly owned subsidiary of Malabar Resources Limited (Malabar) owns and operates the Maxwell Underground Mine. The site is located in the Upper Hunter Valley of New South Wales (NSW), east-southeast of Denman and south-southwest of Muswellbrook. The site consists of the following areas:

- Underground area comprising the area of underground mining operations and the mine entry area (MEA) to support underground mining and coal handling activities and provide for personnel and materials access;
- Maxwell Infrastructure (formerly Drayton mine) comprising previous open cut mining areas, coal handling and preparation plant (CHPP), train load-out facilities and rail loop, Antiene rail spur and other infrastructure and services; and
- Transport and services corridor between the MEA and Maxwell Infrastructure comprising the site access road, an overland conveyor (to be constructed), power supply and other ancillary infrastructure and services.

Description of surface disturbance activities

Exploration activities

Exploration activities may be undertaken during the next three years. Surface trenching, magnetic surveys, test pits and the drilling of cored and non-cored holes are proposed to be undertaken within ML1822. These exploration activities will assist with further defining the geological model and will provide reservoir (gas testing) characterisation. Coal quality and geochemistry assessment may also be undertaken. Geotechnical investigation within ML1822 may be undertaken to inform the detailed designs for the MEA and ventilation shaft (and associated access road/s). Test pits and the drilling of cored and non-cored holes are also proposed to be undertaken on CL 229 during the next 3 years as part of the geotechnical investigations for the Maxwell Solar Farm. Additional drill holes to install groundwater monitoring bores may also be required and appropriate approvals sought.

Construction activities

The following construction activities are proposed to be undertaken during the next 3 years:

- Continued construction of the permanent access road and conveyor trace (including drainage works).
- Installation of the overland conveyor and supporting infrastructure.
- Continued construction of the Whynot and Woodlands Hill portals.
- Continued construction of the drift to the Woodlands Hill seam.
- Construction of the vent shaft and vent fan (including access road, dam, pipelines and powerlines).
- Continued

- installation of supporting infrastructure to the MEA (pipelines and powerlines).
- Continued construction of the MEA and temporary facilities.
- Minor upgrades will be made to the existing blast magazine.
- Improved access to the Southern Void for pumping.
- Installation of the water treatment plant and associated access road.
- Existing light vehicle tracks that are currently used to access mine water storages, pipelines, powerlines and other infrastructure will be maintained.
- The CHPP, train load out facility, rail loop and spur will be subject to ongoing routine inspections and maintenance.

Mining schedule

Mining development method and sequencing and general mine features.

The mine targets mining of the Whynot, Woodlands Hill, Arrowfield and Bowfield Seams, within the Jerrys Plains Subgroup, forming part of the Wittingham Coal Measures. Above the target seams, the stratigraphy of the area consists of a sequence of sandstone, siltstone and laminate units. The Maxwell UG Mine involves the extraction of up to 8 million tonnes (Mt) of ROM coal per year over a period of 26 years from the four seams using the following underground mining methods:

- Underground bord and pillar mining in the Whynot Seam; and
- Underground longwall extraction in the Woodlands Hill Seam, Arrowfield Seam and Bowfield Seam.

Once fully operational, the annual average ROM coal production would be approximately 5.7 Mt, yielding an annual average of approximately 4.8 Mt of product coal. Maxwell estimates ROM coal production will increase over the next three years (in line with operations) ranging from 0.77 Mt to 3.81 Mt. First workings commenced in the Whynot Seam in March 2023. Longwall equipment will start to be delivered to site in Year 1 of this Forward Program. Hunter Valley Energy Coal Pty Ltd (HVEC) operates Mt Arthur Coal. HVEC hold a sublease over a portion of CL229. Any surface disturbance activities and rehabilitation for this area are addressed in the Mt Arthur Coal Forward Program.

Areas identified for emplacements, the sequencing of emplacements, construction, and management.

Due to the underground nature of mining, there are no overburden emplacements proposed for the next three years. However, mine establishment rock removed during construction will be preferentially used at the MEA as construction fill (e.g., for hardstand areas, dam embankments and road construction) or fill for the conveyor trace. The mine establishment rock will be treated with gypsum to improve the sodicity of the material. Any excess mine establishment rock that cannot be utilised at the MEA will be emplaced in the existing Southern Void.

Processing infrastructure activities and the location of tailings facilities and schedule for emplacement.

ROM coal would be temporarily placed on surge stockpiles at the mine entry area prior to reclaiming and transportation via truck and or overland conveyor to the CHPP at Maxwell Infrastructure. The ROM coal would then be handled, sized and processed at the existing CHPP

to produce coking coal (also known as metallurgical coal) and export-quality thermal coal. In the course of processing ROM coal into coal products, a reject material will be produced which generally consists of a mixture of shale, mudstone and sandstone. The reject material is proposed to be pumped via a pipeline to the existing East Void for disposal.

Waste disposal and materials handling operations.

Waste is managed in accordance with the Waste Management Procedure. Where appropriate, spent resources are reused or recycled in preference to being disposed of as waste. Where recycling options are not available, the different classifications of waste will be disposed of in an appropriate off-site waste facility by the site waste contractor. All hazardous chemicals are stored and handled on site as per the Code of Practice for Managing Risks of Hazardous Chemicals in the Workplace (Safe Work Australia, 2019). Controls include labelling and storage of hazardous chemicals in designated bunded areas or approved storage facilities. Spills are managed in accordance with the Spill Response Procedure and Pollution Incident Response Management Plan. Maxwell operates a Bioremediation Area. The preferred approach is to treat contaminated soils onsite, in preference to offsite disposal. Further investigations will be undertaken at mine closure to identify and remediate any contaminated soil that may exist (e.g., in infrastructure areas), in accordance with the requirements of the NSW Contaminated Land Management Act 1997. Contaminated land would be remediated by removal and disposal at an appropriately licensed facility, encapsulation, or appropriate remediation treatment on-site.

Key production milestones

MATERIAL	UNIT	YEAR 1	YEAR 2	YEAR 3
Stripped topsoil <small>(if applicable)</small>	(m ³)	20,000	0	0
Rock/overburden	(m ³)	190,000	0	0
Ore	(Mt)	0.77	2.26	3.81
Reject material¹	(Mt)	0.26	0.73	1.02
Product	(Mt)	0.51	1.53	2.79

¹ This includes coarse rejects, tailings and any other wastes resulting from beneficiation.

Three-year rehabilitation forecast

Rehabilitation planning schedule

Rehabilitation planning schedule

Rehabilitation monitoring is undertaken to compare progress against rehabilitation objectives and completion criteria. The monitoring program includes topsoil analysis, land and soil capability assessment, feed sample analysis, landform stability monitoring, post rainfall inspections, spontaneous combustion inspections, walkover inspections and flora and fauna monitoring. Results from monitoring are discussed in the Annual Review and Annual Rehabilitation Report. Any remedial actions are entered into the site corrective actions database where they are assigned to a role and given a recommended due date. Actions can only be closed out once sufficient evidence of completion is provided. From time-to-time additional studies or assessments will be undertaken and any actions or changes to rehabilitation practices required will be assessed against the current risk assessment and included in the RMP and Forward Program.

Stakeholder consultation

Maxwell is committed to continuing open and constructive dialog with the local community and stakeholders in relation to post mining land use, rehabilitation objectives and completion criteria. Maxwell have engaged with government agencies, community groups and landholders regarding the project design through numerous engagement activities undertaken for the Maxwell UG Project EIS. Maxwell will continue to consult with key stakeholders on rehabilitation and post mining land use. Maxwell has a Community Consultative Committee (CCC) that provides a forum for discussion between Maxwell and representatives of the local community, key stakeholder groups and the local council on issues relating directly to the Maxwell UG Mine. Although the CCC is not a decision-making or regulatory body, it performs an important advisory and consultative role. Maxwell also maintains a 24-hour community hotline (1800 653 960) for any issues or enquiries. General updates about the site including a description of activities being undertaken (construction, mining and rehabilitation) are included in the Maxwell Community Newsletter. Maxwell also has regular discussions with neighbouring landholders to provide updates on site activities and discuss property-specific issues and or concerns.

Rehabilitation studies, risk assessments and/or design work

Environmental issues associated with activities at the site have been assessed as part of the Maxwell EIS. Further to this, a rehabilitation risk assessment has been prepared. The purpose of the risk assessment was to identify and evaluate all potential risks to achieving the final land use and the specific measures to be implemented to mitigate the risks. The risk assessment

was prepared in accordance with AS NZS ISO 31000:2009 Risk Management – Principles and Guidelines. All risks were assessed pre-control (i.e. before any controls were in place) and post-control (i.e. after any existing or additional controls were put in place). A summary of the potential threats identified in the most recent rehabilitation risk assessment are presented in the Rehabilitation Management Plan (RMP). An Assessment Report to address Direction 1 of Notice NTCE0011420 was submitted to the Resource Regulators in May 2023. This report verified previous studies into the rehabilitated landform and surface water structures, measured the erosion rates throughout the rehabilitated landform, provided further detail into capacity of existing rock structures and investigated options for erosion points identified during the Resource Regulator inspection. An implementation schedule (identifying remedial actions) was prepared as part of the Assessment Report and can be found in the RMP. Maxwell has commenced work on the remedial actions.

Rehabilitation research and trials

RRT NUMBER	PROJECT/TRIAL NAME	OBJECTIVE OF TRIAL/PROJECT	METHODOLOGY	EXPECTED DATE OF COMPLETION	STATUS
------------	--------------------	----------------------------	-------------	-----------------------------	--------

FWP0001
373

Rehabilitation maintenance and corrective actions

The following actions may need to be taken as per the recommendations from the ecological monitoring:

- Soil testing and soil amelioration.
- Reseeding or replanting.
- Increased watering of tree plantings
- Herbicide spraying around tree plantings
- Increase in fencing and signage.
- Targeted weed management.
- Increased pest animal management (including kangaroos).
- Reshaping and capping areas of heating from spontaneous combustion.
- Isolating active erosion rills, gullies or washouts and undertaking repairs and reseed as required.
- Monitoring existing water controls and undertaking a review of the landform design.
- Reviewing the adequacy of rock material being used and designs for rock drains.
- Reviewing stocking rates on a regular basis.
- Slash or crash grazing areas (where appropriate).

The following remedial actions (as identified in the Assessment Report) will be complete during this Forward Program:

- Widening of drain ID 10.
- Future erosion quantification work to see if erosion rates trending lower.
- Possible extension of the erosion quantification to check the extent of sediment build up in the contour banks.
- Ongoing assessment of rock weathering.
- Field inspections in support of the above.
- Monitoring the performance of areas potentially impacted on by spontaneous combustion.

Rehabilitation schedule

First workings commenced in the Whynot Seam in March 2023 and first coal was produced from the bord and pillar operation at the end of March 2023. Mining operations were staged during the initial onboarding process and now occur on a continuous basis, 24 hours a day, seven days a week. Drift construction for the Woodland Hill Seam commenced in July 2023 and is continuing. The majority of ground disturbance for construction activities has been undertaken and this is reflected in the forecast numbers. As an underground mine, the project would result in minimal changes to existing landforms. Rehabilitation activities will focus on enhancing existing areas of rehabilitation. There are no new areas of rehabilitation proposed. Key activities will include:

- Infill planting in the woodland rehabilitation corridor to increase species diversity.
- Targeted weed management across the site for High Threat Exotic (HTE) weed species.
- Management of pest animal species in consultation with the Local Land Services and near-neighbours.

Infill planting will be undertaken on rehabilitated areas within the woodland corridor during the next three years. Planting will occur during the optimal seasonal conditions to ensure maximum plant retention. This is likely to be in Autumn (March to April) and Spring (September to October), as temperatures are cooler and rainfall is higher but may be year-round, depending on local weather conditions in the months prior to planting.

Subsidence remediation for underground operations

There are no subsidence monitoring or remediation works proposed. The proposed underground mining includes both first and second workings. The first workings comprise a network of access roadways (i.e. drifts and main headings) that will be designed to remain stable for the life of the mine. The secondary workings associated with the partial pillar extraction and longwalls will result in subsidence that develops predominately above the area of secondary extraction. An Extraction Plan will be prepared prior to second workings, and this will include a Subsidence Monitoring Program.

Progressive mining and rehabilitation statistics

Three-yearly forecast cumulative disturbance and rehabilitation progression

FORECAST	UNIT	YEAR 1	YEAR 2	YEAR 3
A Total surface disturbance footprint	(ha)	1,677.38	1,677.38	1,677.38
B Total active disturbance	(ha)	839.48	839.48	839.48
P Total new area of land proposed for active rehabilitation	(ha)	0	0	0

Rehabilitation key performance indicators (KPIs)

FORECAST	UNIT	YEAR 1	YEAR 2	YEAR 3
O Total new active disturbance area	(ha)	27.18		
P Total new area of land proposed for active rehabilitation during the reporting period	(ha)			
Q Annual rehabilitation to disturbance ratio				

Attachment 1 – Reporting Definitions

REPORTING CATEGORY	DEFINITION
<p>A Total disturbance footprint – surface disturbance</p>	<p>All areas within a mining lease that either have at some point in time or continue to pose a rehabilitation liability due to surface disturbance activities.</p> <p>The total disturbance footprint is the sum of the total active disturbance, decommissioning, landform establishment, growth medium development, ecosystem and land use establishment, ecosystem and land use development and rehabilitation completion (see definitions below).</p> <p>Underground mining operations should not include the footprint of underground mining areas/subsidence management areas in the total disturbance footprint.</p>
<p>B Total active disturbance</p>	<p>Includes on-lease exploration areas, stripped areas ahead of mining, infrastructure areas, water management infrastructure, sewage treatment facilities, topsoil stockpile areas, access tracks and haul roads, active mining areas, waste rock emplacements (active/unshaped/in or out-of-pit), tailings dams (active/unshaped/uncapped) and temporary stabilised areas (e.g. areas sown with temporary cover crops for dust mitigation and temporary rehabilitation).</p>
<p>C Rehabilitation – land preparation</p>	<p>Includes the sum of all disturbed land within a mining lease that have commenced any, or all, of the following phases of rehabilitation – decommissioning, landform establishment and growth medium development.</p> <p>Refer to the glossary of terms in this document for the definition of these phases of rehabilitation.</p>
<p>D Ecosystem and land use establishment</p>	<p>Includes the area which has been seeded/planted with the target vegetation species for the intended final land use. However, vegetation has not matured to a stage where it can be demonstrated that it will be sustainable for the long term and or require only a maintenance regime consistent with target reference/analogue sites.</p> <p>Typically, rehabilitation areas would be in this phase for at least two years (and usually more) before rehabilitation can be classified as being in the ecosystem and land use development phase. This phase does not apply to infrastructure areas that are being retained as part of final land use for the site.</p>

REPORTING CATEGORY	DEFINITION
O	The area of any new active disturbance that will be created during the next three years, as defined under definition A1 (definition A1 Table 5).
P	The sum of any new rehabilitation to be commenced in the next three years. These areas may be in the phases “Rehabilitation - Land Preparation” or the “Ecosystem & Land Use Establishment” (definitions C & D in Table 5).
Q	The rehabilitation to disturbance ratio (S / R) indicates how many hectares of new rehabilitation are undertaken for each hectare of land disturbed during the three years. A ratio of 1/1 indicates that the area of new rehabilitation and disturbance in that period are the same.

Attachment 2 – Definitions

WORD	DEFINITION
Active	In the context of rehabilitation, land associated with mining domains is considered 'active' for the period following disturbance until the commencement of rehabilitation.
Active mining phase of rehabilitation	In the context of rehabilitation, the active mining phase of rehabilitation constitutes the rehabilitation activities undertaken during mining operations such as salvaging and managing soil resources, salvaging habitat resources, and native seed collection. This phase also includes management actions taken during operations to manage risks to rehabilitation and enhance rehabilitation outcomes such as selective handling of waste rock and management of tailings emplacements.
Analogue site	In the context of rehabilitation, an analogue site is a 'reference site' that represents an example of the defining characteristics (such as vegetation composition and structure or agricultural productivity) of the final land use. Characteristics of analogue sites can be assessed to develop the rehabilitation objectives and completion criteria for final land use domains.
Annual rehabilitation report and forward program	As described in the Mining Regulation 2016.
Annual reporting period	As defined in the Mining Regulation 2016.
Closure	A whole-of-mine-life process, which typically culminates in the relinquishment of the mining lease. It includes decommissioning and rehabilitation to achieve the approved final land use(s).
Decommissioning	The process of removing mining infrastructure and removing contaminants and hazardous materials.
Decommissioning Phase of Rehabilitation	Activities associated with the removal of mining infrastructure and removal and/or remediation of contaminants and hazardous materials. In the context of the rehabilitation management plan this phase of rehabilitation may also include studies and assessments associated with decommissioning and demolition of infrastructure or works carried out to make safe or 'fit for purpose' built infrastructure to be retained for future use(s) following lease relinquishment.

WORD	DEFINITION
Department	The Department of Regional NSW.
Disturbance	See Surface Disturbance.
Disturbance area	<p>An area that has been disturbed and that requires rehabilitation.</p> <p>This may include areas such as on-licence exploration areas, stripped areas ahead of mining, infrastructure areas, water management infrastructure, sewage treatment facilities, topsoil stockpile areas, access tracks and haul roads, active mining areas, waste emplacements (active/unshaped/in or out-of-pit), tailings dams (active/unshaped/uncapped), and areas requiring rehabilitation that are temporarily stabilised (i.e. managed to minimise dust generation and/or erosion).</p>
Domain	<p>An area (or areas) of the land that has been disturbed by mining and has a specific operational use (mining domain) or specific final land use (final land use domain). Land within a domain typically has similar geochemical and/or geophysical characteristics and therefore requires specific rehabilitation activities to achieve the associated final land use.</p>
Ecosystem and Land Use Development	<p>This phase of rehabilitation consists of the activities to manage maturing rehabilitation areas on a trajectory to achieving the approved rehabilitation objectives and completion criteria.</p> <p>For vegetated land uses this phase may include processes to develop characteristics of functional self-sustaining ecosystems, such as nutrient recycling, vegetation flowering and reproduction, and increasing habitat complexity, and development of a productive, self-sustaining soil profile.</p> <p>This phase of rehabilitation may include specific vegetation management strategies and maintenance such as tree thinning, supplementary plantings and weed management.</p>
Ecosystem and Land Use Establishment	<p>This phase of rehabilitation consists of the processes to establish the approved final land use following construction of the final landform.</p> <p>For vegetated land uses this rehabilitation phase includes establishing the desired vegetation community and implementing land management activities such as weed control. This phase of rehabilitation may also include habitat augmentation such as installation of nest boxes.</p>
Exploration	Has the same meaning as that term under the State Environmental Planning Policy (Mining, Petroleum Production and Extractive Industries) 2007.

WORD	DEFINITION
Final landform and rehabilitation plan	As defined in the Mining Regulation 2016.
Final land use	As defined in the Mining Regulation 2016.
Form and way	Means the form and way approved by the Secretary. Approved form and way documents are available on the Department’s website.
Growth Medium Development	<p>This phase of rehabilitation consists of activities required to establish the physical, chemical and biological components of the substrate required to establish the desired vegetation community (including short lived pioneer species).</p> <p>This phase may include spreading the prepared landform with topsoil and/or subsoil and/or soil substitutes, applying soil ameliorants to enhance the physical, chemical and biological characteristics of the growth media, and actions to minimise loss of growth media due to erosion.</p>
Habitat	Has the same meaning as that term under the <i>Biodiversity Conservation Act 2016</i> and the <i>Fisheries Management Act 1994</i> (as relevant).
Indicator	An attribute of the biophysical environment (e.g. pH, topsoil depth, biomass) that can be used to approximate the progression of a biophysical process. It can be measured and audited to demonstrate (and track) the progress of an aspect of rehabilitation towards a desired completion criterion (i.e. defined end point). It may be aligned to an established protocol and used to evaluate changes in a system.
Land	As defined in the <i>Mining Act 1992</i> .
Landform Establishment	<p>This phase of rehabilitation consists of the processes and activities required to construct the final landform.</p> <p>In addition to profiling the surface of rehabilitation areas to the approved final landform profile this phase may include works to construct surface water drainage features, encapsulate problematic materials such as tailings, and prepare a substrate with the desired physical and chemical characteristics (e.g. rock raking or ameliorating sodic materials).</p>
Large mine	As defined in the Mining Regulation 2016.
Lease holder	The holder of a mining lease.

WORD	DEFINITION
Life of mine	The timeframe of how long a mine is approved to mine, from commencement to closure.
Mine rehabilitation portal	<p>Means the NSW Resources Regulator’s online portal that lease holders must use (via a registered account) to:</p> <ul style="list-style-type: none"> ■ upload rehabilitation geographical information system (GIS) spatial data ■ develop rehabilitation GIS spatial data (using online tracing functions) ■ generate rehabilitation plans and rehabilitation statistics using the map viewer and Rehabilitation Key Performance Indicator functionalities. <p>Data submitted to the mine rehabilitation portal is collated in a centralised geodatabase for use by the NSW Resources Regulator to regulate rehabilitation performance of lease holders.</p>
Mining area	As defined in the <i>Mining Act 1992</i> .
Mining domain	A land management unit with a discrete operational function (e.g. overburden emplacement), and therefore similar geophysical characteristics, that will require specific rehabilitation treatments to achieve the final land use(s).
Mining land	As defined in the <i>Mining Act 1992</i> .
Native vegetation	Has the same meaning as that term under section 60B of the <i>Local Land Services Act 2013</i> .
Overburden	Material overlying coal or a mineral deposit.
Performance indicator	An attribute of the biophysical environment (for example pH, slope, topsoil depth, biomass) that can be used to demonstrate achievement of a rehabilitation objective. It can be measured and audited to demonstrate (and track) the progress of an aspect of rehabilitation towards a desired completion criterion, that is, a defined end point. It may be aligned to an established protocol and used to evaluate changes in a system.

WORD	DEFINITION
Phases of rehabilitation	<p>The stages and sequences of actions required to rehabilitate disturbed land to achieve the final land use. The phases of rehabilitation are:</p> <ul style="list-style-type: none"> ■ active mining ■ decommissioning ■ landform Establishment ■ growth medium development ■ ecosystem and land use establishment ■ ecosystem and land use development.
Progressive rehabilitation	<p>The progress of rehabilitation towards achieving the approved rehabilitation completion criteria. This may be described in terms of domains, phases, performance indicators and rehabilitation completion criteria.</p>
Rehabilitation Completion	<p>The final phase of rehabilitation when a rehabilitation area has achieved the approved rehabilitation objectives and rehabilitation completion criteria for the final land use. Rehabilitation areas may be classified as complete when the NSW Resources Regulator has determined in writing that the relevant rehabilitation obligations have been fulfilled following submission of <i>Form ESF2 Rehabilitation completion and/or review of rehabilitation cost estimate</i> application by the lease holder.</p>
Rehabilitation Completion criteria	<p>As defined in the Mining Regulation 2016.</p>
Rehabilitation cost estimate	<p>As defined in the Mining Regulation 2016.</p>
Rehabilitation management plan	<p>As defined in the Mining Regulation 2016.</p>
Rehabilitation objectives	<p>As defined in the Mining Regulation 2016.</p>
Rehabilitation risk assessment	<p>As defined in the Mining Regulation 2016.</p>
Rehabilitation schedule	<p>The defined timeframes for progressive rehabilitation set out in the forward program.</p>

WORD	DEFINITION
Relevant stakeholders	<p>Means any persons or bodies who may be affected by the mining operations, including rehabilitation, carried out on the lease land, and includes:</p> <ul style="list-style-type: none"> ■ the relevant development consent authority ■ the local council ■ the relevant landholder(s) ■ community consultative committee (if required under the development consent) or equivalent consultative group ■ affected land holder(s) ■ government agencies relevant to the final land use ■ affected infrastructure authorities (electricity, telecommunications, water, pipeline, road, rail authorities) ■ local Aboriginal communities, and ■ any other person or body determined by the Minister to be a relevant stakeholder in relation to a mining lease.
Risk	The effect of uncertainty on objectives. It is measured in terms of consequences and likelihood (AS/NZS ISO 31000:2009).
Secretary	The Secretary of the Department.
Security deposit	An amount that a mining lease holder is required to provide and maintain under a mining lease condition, to secure funding for the fulfilment of obligations under the lease (including obligations that may arise in the future).
Surface disturbance	Includes activities that disturb the surface of the mining area, including mining operations, ancillary mining activities and exploration.
Tailings	A combination of the fine-grained solid material remaining after the recoverable metals and minerals have been extracted from the mined ore, and any process water ² .
Waste	Has the same meaning as that term under the <i>Protection of the Environment Operations Act 1997</i> .

² Commonwealth of Australia (DITR), 2007. *Tailings Management*.
